9.2.7.1.1	Single loop controller	
9.2.7.1.2	2 Dual loop controller	
9.2.7.2	Calculation algorithm of the controller	
9.2.7.3	Set up the PID control	
9.2.7.3.1	General set up	
9.2.7.3.2	2 Output	
9.2.7.3.3	Operation	
9.2.7.3.4	Fault handling	
9.2.7.3.5	5 Tuning	

9.2.7.4 Operation of the PID control	
9.2.7.4.1 Operation of single loop controller	
9.2.7.4.2 Operation of dual loop controller	
9.2.7.5 Modbus register map of the PID control parameters	
9.3 Alarms and events system	
9.3.1 I/O channel alarms	
9.3.1.1 Analog input channel (4-20 mA) alarms	
9.3.1.2 PRT/RTD (Pt100) channel alarms	
9.3.1.3 Pulse input channel (flow pulse signal) alarms	
9.3.1.4 Pulse input channel (flow frequency signal) alarms	
9.3.1.5 Pulse input channel (density frequency signal) alarms	
9.3.1.6 Analog output (4-20 mA) channel alarms	
9.3.1.7 Pulse output channel alarms	
9.3.1.8 Modbus (serial communication) channel alarms	
9.3.2 Metering stream alarms	
9.3.2.1 Calculation alarms	
9.3.2.2 Stream fault alarm	
9.3.3 Common alarm and status output	
9.3.3.1 Status output	
9.3.4 Alarm list	
9.3.5 Events list	
9.3.6 Download log	
9.4 Tests	
9.4.1 Tests – ANI4PT2 board	
9.4.2 Tests – ANI8 board	
9.4.3 Tests – PT4 board	
9.4.4 Tests – AODIO484 board	
9.4.5 Tests – PDIO484 board	
9.4.6 Tests – PITC4641 board	
9.4.7 Tests – Com port monitor	
9.4.8 Tests – Modbus TCP monitor	
9.5 Calibration	
9.5.1 Rosemount 3095 calibration	
9.6 Help	
9.7 Language/Nyelv/Язык/Limba	
10 Communication	
10.1 Serial link setup	
10.2 Ethernet link setup	
10.3 Communication device address	
10.4 Protocol implementation	
10.4.1 Implemented Modbus command codes	
10.4.1.1 Read multiply registers (code: 3)	

10.4.1.2	Write multiply registers (code: 16)	
10.4.2	Calculation of CRC check sum	
10.4.3	Data types in the Modbus registers	
10.4.3.1	8 bit binary unsigned integer	
10.4.3.2	16 bit binary unsigned integer	
10.4.3.3	32 bit binary signed integer	
10.4.3.4	Floating point number	
10.5 Stand	ard Modbus register map (2 byte/register)	
10.5.1	Accessing periodic totals	
10.5.2	Accessing batch data	
10.5.2.1	Accessing batch data in case of "Tank loading/unloading" batch	
10.5.2.2	Accessing batch data in case of "Pipeline product interface" batch	
10.5.3	Accessing flow meter serial test data	
10.6 Danie	el Modbus register map (4 byte/register)	
10.6.1	Registers for system date and time modification via Modbus link	
10.6.2	Registers for totals	
10.6.3	Registers for other measured data	
10.7 Regis	ter maps of the Modbus Slave devices	
10.7.1	Register map of Caldon LEFM 380Ci ultrasonic meter	
10.7.2	Register map of Daniel ultrasonic meter (Mark III electronics)	
10.7.3	Register map of Flexim Fluxus ultrasonic meter	
10.7.4	Register map of Sick-Maihak Flowsic-600 ultrasonic meter	
10.7.5	Register map of Krohne Altosonic V12 ultrasonic meter	
10.7.6	Register map of Panametrics GC868 ultrasonic meter	
10.7.7	Register map of Instromet QSonic Uniform ultrasonic meter	
10.7.8	Register map of Instromet QSonicPlus ultrasonic meter	
10.7.9	Register map of RMA Ecosonic12 ultrasonic meter	
10.7.10	Register map of RMG USZ08 ultrasonic meter	
10.7.11	Register map of Siemens 1010GCGDN ultrasonic meter	
10.7.12	Register map of Sick FLOWSIC-600XT ultrasonic meter	
10.7.13	Register map of FMC MPU Series B ultrasonic meter	
10.7.14	Register map of ABB NGC820X gas chromatograph	
10.7.15	Register map of ABB2 gas chromatograph	
10.7.16	Register map of Daniel Danalyzer C6+ gas chromatograph	
10.7.17	Register map of Daniel Danalyzer C9+ gas chromatograph	
10.7.18	Register map of Yamatake HGC gas chromatograph	
10.7.19	Register map of Yokogawa gas chromatograph	
10.7.20	Register map of Elster EnCal3000 gas chromatograph	
10.7.21	Register map of Emerson 3095FB multiparameter transmitter	
10.7.22	Register map of Krohne MFC300 mass flow meter transmitter	
10.7.23	Register map of Emerson Micromotion mass flow meter

1 About this manual

This manual introduces the UNIFLOW-200 multifunction flow computer. It describes the installation procedure and shows how to operate the system including entering and modifying data. Basic maintenance and troubleshooting information is also provided. The information in this manual is arranged as follows:

Section 2 – Introduction provides an overview of the UNIFLOW-200 including the list of metering standards, fluids and flow meters available in the flow computer for configuration.

Section 3 – Technical specification contains a complete list of physical, performance, and environmental specifications of the UNIFLOW-200.

Section 4 – Plug-in boards and hardware operation provides the list of I/O boards available for selection together with their I/O channel capabilities. This section consists of the short description of the hardware operation of the flow computer.

Section 5 – Installation and wiring provides instruction on installing the UNIFLOW-200. It describes the field wiring configurations.

Section 6 – Basic operation shows how to use the UNIFLOW-200. This includes keypad functions, screen displays, system initialization, display navigation, data entry, and printing reports.

Section 7 – Maintenance and troubleshooting provides maintenance and troubleshooting information, including the basic board-level test procedures.

Section 8 – Support describes the software tools provide for the convenience of operation of the UNIFLOW-200.

Section 9 – Detailed operation – The menu tree describes in depth the menu structure of the UNIFLOW-200. It guides through the steps required to setup the UNIFLOW-200 for a particular flow measurement task. It gives the full list of options available for selection in the setup procedure.

Section 10 – Communication describes the communication capabilities of the UNIFLOW-200.

Annex A – Reports gives examples of the periodic reports available in the UNIFLOW-200 for uploading and printing.

Annex B – User report editor explains the operation of the user report editor available on the web server of UNIFLOW-200.

Annex C – User Modbus editor explains the operation of the Modbus editor available on the ToolBox and allowing create tailored Modbus register tables.

Annex D – Application notes for HTI4x15 I/O board

Annex E – Drawings includes the drawings.

2 Introduction

UNIFLOW-200 multifunction flow computer is designed to measure flow of fluids flowing in closed conduits (gas, liquid, water and steam) and open channel (water). The flow computer performs the data processing and displaying function in the flow metering system. The flow computer calculates the volume at line and at base conditions, mass and energy flow rate of the fluid. It totalizes the volume at line and at base conditions, mass and energy flow rate of the fluid. It totalizes the volume at line and at base conditions, mass and energy for the accounting periods.

The flow computer was designed to provide cost effective solution for multi stream applications. Benefits of the flow computer allowing remarkable cost reduction comparing to the single stream flow computers:

- sharing of the transmitters between metering streams is possible;
- PRT/RTD sensors can be connected directly to the flow computer; no temperature transmitter is required;
- power supply output for transmitters is provided; no separate power supply units required;
- additional I/O modules expand the metering capability of the flow computer with moderated additional cost only;
- flexible communication capabilities allow easy system integration.

The manufacturer Process Control Kft. provides support for the end users to integrate the flow computer into metering systems and into data acquisition and process visualization systems. The manufacturer also can provide complete solution for flow metering task, including the design, manufacturing and implementation if required.

Flow meters that can be selected in the flow computer and the standards related

- pressure differential devices;
 - orifice plate, nozzle, Venturi tube (ISO 5167, edition 1991, 1998 or 2003, GOST 8.563-97, GOST 8.586-2005, AGA3 edition 1990 or 2012)
 - V-Cone meter (according to manufacturer's method);
 - Annubar (according to manufacturer's method);
 - segmental orifice plate;
 - conditioning orifice plate.
- flow meters with linear output signal;
 - turbine meter;
 - Vortex meter;
 - electromagnetic flow meter;
 - ultrasonic flow meter;
 - mass flow meter;
 - volume at base conditions flow meter.
 - flow meters with nonlinear output signal;
 - rotameter;
 - flow meter with power characteristic.

Fluids that can be selected in the flow computer together with fluid properties calculation

- hydrocarbon gas mixtures (natural gas, coke oven gas, blast furnace gas);
- pure gases (air, nitrogen, oxygen, argon, carbon-monoxide, ethylene, ammonia, propane, general gas)
- steam and hot water as energy supply fluids;
- liquids (crude oil, refined products, lubricating oil, NGL & LPG, UGC, SHL, WFLH, ethanol, general liquid, liquid mixture);

Standards and procedures for fluid properties calculation

- hydrocarbon mixtures
 - compression factor
 - o AGA8 (1985 and 1992) detailed and gross methods; AGA NX19;
 - o AGA8 Part 1-2017 (DC, Gross Method 0, Method 1, Method 2, Method 3)
 - o AGA8 Part 2-2017
 - o GERG88;
 - o GOST 30319-96 (GERG91mod, NX19mod, VNIC SMV), GOST 30319-2015.
 - calorific values, relative density and base density
 - o ISO 6976 (1995 and 2016), GOST 30319-96, AGA5, GPA 2172-09.
 - dynamic viscosity
 - o GOST 30319-96, GOST 30319-2015

- isentropic exponent
 - ISO 20765-1, GOST 30319-96, GOST 30319-2015, AGA8 Part 1-2017, AGA8 Part 2.2017
- velocity of sound ISO 20765-1, GOST 30319-96, GOST 30319-2015, AGA8 Part 1-2017, AGA8 Part 2.2017
- Joule-Thomson coefficient
- o ISO 20765-1, ISO TR 9464, AGA8 Part 1-2017, AGA8 Part 2.2017
- gas composition
 - o read on-line from a gas chromatograph,
 - o downloaded from a supervisory system,
 - o fixed value.
- pure gases

•

- compression factor, dynamic viscosity and isentropic exponent
- crude oil and refined products
 - temperature volume correction factors
 - o ASTM D1250-80/API 2540 Table 23/24A,B,C, Table 53/54A,B,C

 - o Council Directive 76/766/EEC
 - Horst Bettin, Frank Spieweck: A Revised Formula for the Calculation of Alcoholometric Tables. PTB-Mitteilungen 100 6/90

UNIFLOW-200 is a Gas-volume electronic conversion device complying with EN 12405 and OIML R140. UNIFLOW-200 is approved as Calculator for Dynamic measuring system for liquids other than water according to OIML R 117-1. UNIFLOW-200 calculates the CO2 emission for gaseous and liquid fuels according to 601/2012/EU and IPCC 1996.

UNIFLOW-200 is capable to provide flow computer function up to 8 metering streams. In other words: in one UNIFLOW-200 we have 8 independent flow computers.

In general, each metering stream has the input signals as follows:

- flow meter signal
- signals for correction (pressure, temperature, density, gas composition, etc.)

Depending on the application one single signal for correction can be assigned to several metering streams. If here is no transmitter for a particular signal for correction the flow computer will use a fixed value for that signal.

In case of signal failure, the flow computer revert to the fixed value of that signal and this value will be used in the flow calculation.

Beside the 8 physical metering streams the flow computer is capable to provide 4 virtual metering streams. The virtual metering streams are to produce data from the flow rates of the physical metering streams. The virtual streams can be configured to give sum, difference, product or ratio (or their combination) of the physical streams. It can be used to setup a simple energy balance for a small group of consumers.

The accuracy of the flow measurement is a key issue. UNIFLOW-200 high precision inputs, the implementation of the latest editions of the flow metering standards provide minimum contribution of the flow computer in the uncertainty budget of the metering system.

Utilization of the digital communication with the flow meters and transmitters can further reduce the overall uncertainty of the measurement.

Technical specification 3

3.1 General features

- high capacity 32-bits microprocessor •
- modular design, up to 5 I/O boards •
- up to 8 physical metering streams •
- up to 4 virtual metering streams
- flow meters: orifice plate, nozzle, Venturi tube, segmental orifice plate, Annubar, Verabar, Accelabar, V-Cone meter, turbine meter, Vortex meter, ultrasonic meter, electromagnetic meter, mass flow meter, rotameter, meter with power characteristic
- fluids: gas, liquid and water steam
- mode of operation: metering mode, configuration mode, test mode
- configuration: from keypad and via Ethernet link
- password protected parameters, audit trial log
- parameters and totals integrity protection: nonvolatile memory
- archiving: hourly, shift, daily, multi-day and monthly totals and averages for 400 days
- operator interface: alphanumerical and graphical display
- up to 8 RS232/RS485/RS422 serial ports, 10/100 Ethernet and USB interface
- stream independent signal processing
- high reliability, no battery, no potentiometers
- support: U200ToolBox configuration and remote archive uploader software

3.2 **Technical data**

Analog inputs

- symmetrical inputs with galvanic isolation ٠
- input range 0-20 mA / 4-20 mA (operator selectable) •
- accuracy +/- 0,02 %
 - 5,4 V max. per 20mA(100 Ω + protection) potential drop on input

4-wire

- equivalent input impedance 270 ohm (100 Ω + protection)
- potential diff. among inputs 50 V max.

PRT/RTD inputs

- sensor type 100 ohms PRT standard (50, 500 or 1000 ohms PRT optional) • sensor calibration
 - CVD coefficients for individually calibrated sensors accepted
- connection •
- accuracy
 - +/- 0.03 °C maximum loop resistance 3 kohms
- excitation current 1 mA

Pulse/frequency inputs

Signal type (operator selectable)

•

- open collector, potential-free contact powered from UNIFLOW-200, 12 V/3 mA
- active signal (externally powered) square, unipolar
 - 5 V max. 5 V, signal level change min. 2 V •
 - 15 V max. 15 V, signal level change min. 5 V
- NAMUR
 - powered from UNIFLOW-200, 8,2 V,
 - input impedance 1 k Ω , .
 - signal level change, min. 1,5 mA.
- frequency range
- signal form

0...10000 Hz

signal counting

square, unipolar without loss of pulses

0.001 % max.

- Uncertainty of frequency measurement

Digital inputs

- potential-free contacts, open collector inputs (transistor) or 24 VDC inputs accepted and used as:
 - static inputs, or •
 - pulse inputs (frequency: 100 Hz max., 50 % fill in ratio) •
- internal power supply for potential-free inputs: 12 VDC, 6,8 kohm

Analog outputs

- output channels with individual galvanic isolation •
- 0-20 mA / 4-20 mA (operator selectable) current range •
- resolution 12 bits •
- 500 ohm max. load

Digital outputs

- galvanically isolated open collector (transistor), overvoltage- and overcurrent-protected outputs
- type of outputs
 - o dual state static signal
 - o flow rate limits
 - o analog input limits
 - repeating dual state input signal with negation/delay 0
 - common alarm output 0
 - pulse signal 0
 - pulse output proportional to totals 0
 - time base 0
 - Max. frequency: 50 Hz,
 - On/off time duration min. 10 msec
 - 100 mA. 40 Vdc max. load

High frequency (HF) pulse output

- repeats pulses from one of the selected high frequency pulse inputs (transmitting input pulses to prover computer) •
- open collector (transistor), overvoltage- and overcurrent-protected output, 50 mA, 40 V max. (external supply) •
- frequency range: 0 ... 10 000 Hz •
- pulse repeating without pulse losses

Digital communication

- serial links overvoltage- and overcurrent-protected
 - RS232/RS485/RS422 (operator selectable) mode • •
 - baud rate 1200...38400 baud (operator selectable) protocol
 - Modbus ASCII and RTU
- RS232 maximum cable length
- 15 m RS485/RS4222 1200 m protocol: Modbus TCP
- 10/100 Ehernet

USB 1.1 port standard-A receptacle, for data saving to flash drive • flash drive shall be formatted for FAT32 file system

Hot/stand-by interface

- flow computer status output (to stand-by unit)
 - change-over voltage-free contact, maximum load: 100 V, 100 mA
 - operating closed contact (NO) •
 - fault opened contact (NC)
- flow computer status input (from hot unit) • potential-free contact, open collector inputs (transistor) or 24 VDC input
 - sensing input sense

Keyboard

foil protected membrane keyboard

Display

3,5" QVGA (320 x 240) backlit TFT color LCD

Performance specification

Maximum Permissible Error (MPE)

- +/- 0.03 % OIML R117, Class 0,3 • • +/- 0.2 % EN 12405
 - +/- 0.05 % OIML R140 •

Operating conditions

operating temperature -10...+60 °C • operating humidity 10...90 % non-condensing • EMC complies with EU EMC regulation • -25...+70 °C storage temperature

Power requirements

•	power supply	230 VAC +10 %/-15 %, 50 Hz +/-3 Hz
		24 VDC nominal, 20 VDC 35 VDC
٠	power consumption	25 VA max. (depending on the number and type of IO boards fitted)
•	transmitter power (output)	1 x 24 Vdc, 200 mA max.

Case and mounting

Panel mounted version

- 196 mm W x 110 mm H front panel • • case depth 272 mm
- minimum cabinet depth 320 mm •
- panel cutout

* Depends on the number of I/O boards fitted

** Depends on the number of serial links fitted

4 Plug-in boards and hardware operation

The modular design of the flow computer allows flexible combination of the I/O boards to suit different applications. The flow computer consists of the modules as listed below:

•	mother board	part of the base unit
•	front panel with keypad and display	part of the base unit
•	power supply unit	part of the base unit
•	CPU board	part of the base unit
•	I/O boards	application dependent
٠	serial extension module	application dependent

The maximum number of I/O boards that can be installed is five. The maximum number of metering streams (8) can be defined only if the total number of input and output channels is covered by the properly selected five I/O boards. Otherwise more than one UNIFLOW-200 should be installed.

The base unit provides communication interfaces as listed below:

•	serial link (RS232/RS485/RS422)	1
•	USB host	1
•	10/100 Ethernet	1

4.1 Plug-in boards

The available I/O boards listed in the table below:

I/O board name	Number of channels	Signal	Remark
ANI8	8	4-20 (0-20) mA current input	selectable
	1	24 VDC/200 mA transmitter power	
ANI4PT2	4	4-20 (0-20) mA current input	selectable
	2	100 ohms PRT/RTD input	4-wire connection
	1	24 VDC/200 mA transmitter power	
PT4	4	100 ohms PRT/RTD input	4-wire connection
			(50, 500, 1000 ohms optional)
PDIO484 (obsolete,	4	pulse/frequency input	high level (active or passive)
replacement type	8	digital (contact) input	static or pulse
PITC4641)	4	digital (open collector) output	static or pulse
AODIO484	4	4-20 (0-20) mA current output	selectable
	8	digital (contact) input	static or pulse
	4	digital (open collector) output	static or pulse
PITC4641	4	pulse/frequency input	high level (active or passive)
	6	digital (contact) input	static or pulse
	4	digital (open collector) output	static or pulse
	1	raw pulse output	repeats selected HF pulse
			input for prover computer
HTI4x15	32	HART communication input in	The loops are isolated if
		multidrop or broadcast mode	external power supply is used
		4 independent loops, 15 PV per loops	
Any I/O board can be	fit into any I/O	slot. Software recognizes the type of the	e fitted I/O boards automatically.

Table 4-1 I/O board types

The available communication interfaces listed in the table below:

Communication module	Туре	Remark
Com1 port	universal serial port	part of the base unit on the CPU board RS232/RS485/RS422 – selectable
SE module*	serial extension module	additional com2 and com3 ports RS232/RS485/RS422 – selectable Does not occupy I/O board slot.
CX5*	5-channel serial extension board	additional com4 to com 8 ports RS232/RS485/RS422 – selectable Occupy No.5 I/O board slot.
10/100 port	10/100 baseT Ethernet interface	part of the base unit on the CPU board
USB port	USB 1.1 host	part of the base unit on the CPU board
	None, one of them or both can be installed, o it into I/O slot No.5 only.	depending on the number of ports required.

Table 4-2 Communication interfaces

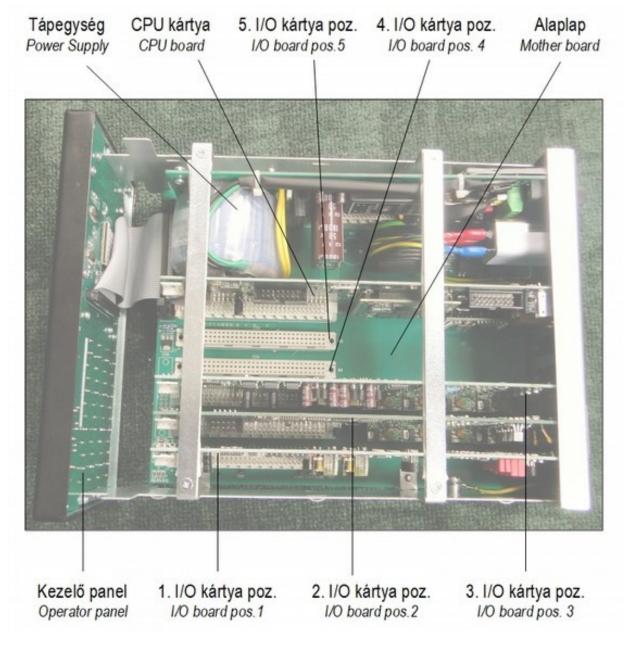

Figure 4-1 I/O board locations

4.2 Hardware operation

The flow computer is built on the basis of the ATMEL ATSAMA5D31 microprocessor.

The application software of the flow computer runs under the UX200 operating system.

The operating system, the application software and the archived data are stored in the Micro SD flash memory, min. 32 GB (PCMCIA device).

All the parameters, calculation data and archive data are stored in flash memory so that the data are retained in case of power failure.

The working memory of the flow computer is 512 MB SDRAM.

The real time clock chip (DALLAS DS3234) provides the time and date for the operation. It provides also 500 ms interrupts for the processor to synchronize the calculation cycles. The clock chip has its own built-in lithium battery providing independent operation from the external power.

The human – machine interface of the flow computer is the 320x240 dots backlit colour LCD and the foil protected membrane keyboard.

There are three LEDs on the front panel.

The POWER LED indicates the presence of power supply.

The RUN LED indicates the normal operation of the flow computer.

The ALARM LED indicates the alarm status.

The Com1 ... Com8 serial ports provide asynchronous communication links to external devices. All of them can be configured as RS23 or RS485 or RS422 port. The parameters of the ports (baud rate, data bits, stop bits, parity) are operator selectable.

The 10/100 BaseT Ethernet port allows to connect the flow computer to the LAN or WAN. The parameters of the Ethernet port (IP address, subnet mask, default gateway) are operator selectable. The Ethernet port can be configured to provide DHCP function.

The USB port is provided for easy transfer of the archive data files to flash drive.

The flow computer can accommodate up to five I/O boards for field signal connection. It is recommended to install the I/O boards in the numbered slots starting from one. The type of the I/O boards is recognized automatically by the CPU board.

The status of the flow computer (normal operation or in error) is signalled with a dual state double pole voltage free contact. The state of the contact and the state of the RUN LED are synchronized. See details in the section <u>9.3.3</u>

The power supply unit provides two independent groups of voltages for the flow computer operation. The voltages are isolated by DC/DC converters for high noise immunity. The voltages are:

- TTL level voltage
 - +5 V (Vcc) to supply the digital circuits
 - o prediction of power failure to provide
 - smooth program stopping and
 - finishing the data saving process
- voltage for analogue circuits
 - +24 V for transmitter power supply
 - +/-15 V to supply the analogue circuits

The I/O boards include also DC/DC converters to isolate the field input signals and the communication interfaces from the internal circuits.

The flow computer can be powered from:

- 230 V 50 Hz or
- 24 V DC

power source. Both power sources can be connected simultaneously. If power exists on both power inputs then the flow computer takes power from the 230 V 50 Hz inputs. If the power fails on this input then the flow computer automatically switch to the 24 VDC power input. The power switch over will not affect the operation of the flow computer.

To assure high reliability and low maintenance no potentiometers and no batteries are installed in the flow computer.

5 Installation, wiring and start-up

UNIFLOW-200 flow computer is designed for panel mounting. Its outer case is made of painted welded steel list to provide magnetic screening.

The mechanical structure of the flow computer is constructed in such a way that after loosing the two fixing screws on the back side of the unit the complete internal can be pulled out from the front. The terminals and the sockets for the signal connections and the fuse holders are located on the backplane of the unit.

The base unit consists of 4 PCBs, the mother board, the front panel, the power supply and the CPU. The front panel connects to the mother board with flat ribbon cable. The CPU board and the power supply are connected to the mother board with multi-pin sockets. There are 5 off 64-pin sockets on the mother board to accommodate the I/O boards for field signals. The field signals are connected to the 25-pin DSUB sockets located at the rear edge of the I/O boards.

5.1 Installation

Installation of the UNIFLOW-200 must conform to all applicable local codes and regulations. All installation procedures should be in accordance with normal practices of good workmanship.

The UNIFLOW-200 panel mount is designed for use within the control room and should be placed in a position that provides ease of use, comfort, and safety for operators and maintenance personnel. The optimum height for viewing and using the display and keypad is at operator eye level.

CAUTION

Where one or more units are installed in a confined space or with other heat producing equipment, special attention should be given to the combined heating effect. This combined heat could increase the environmental temperature beyond its acceptable threshold impacting performance.

Prepare the requested cut out in the panel for mounting. Refer to the drawing in the Annex B. Panel thickness should be at least 3 mm to prevent distortion.

Carefully slide the UNIFLOW-200 into the cut out. Secure the unit in the panel by means of the four fasteners supplied with the unit.

5.2 Wiring

All local wiring practices and regulations should be observed performing the wiring.

The connectors and terminals accepting external wiring are located on the backplane of the flow computer as shown on the figure below.

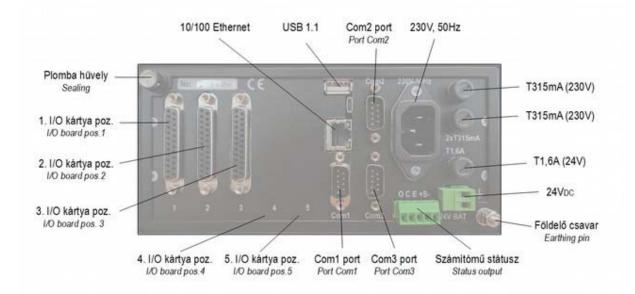

Figure 5-2 Backplane connectors

Power supply

Two different power supply inputs are available on the UNIFLOW-200. Both power supply input can be connected at the same time.

230 V 50 Hz power supply is connected via IEC60320 C14 chassis plug.

CAUTION

UNIFLOW-200 shall be connected to the power supply system with protective ground.

24 VDC power supply connection is made by a plug-in screw terminal. The terminal is labeled 24 V BAT.

Serial ports

Three communication ports are provided on the backplane of the flow computer.

The ports use 9-pin DSUB male connectors and are labeled COM1, COM2 and COM3.

The pin assignments of the connectors in case of RS232/RS485/RS422 configuration see in the Appendix B.

Ethernet port

This port is for high-speed communications using Ethernet local area network architecture. The speed of data transfer is 10/100 Mb/sec using a 10baseT twisted pair. The port uses an RJ45 connector.

USB port

USB port is for file transfer from the flow computer to flash drive device. The port uses a standard-A receptacle.

Status output and Sense input

A single pole, double throw relay with Normally Open or Normally Closed terminals provides the status (operating and error) of the flow computer. A flow computer failure causes the relay to de-energize. Connection is made by plug-in screw terminals. Contact is rated at 100 mA, 100 volts and is a Form "C" contact.

The terminals are marked:

- O operating
- C common
- E fault

The Sense input accepts potential-free contact, open collector inputs (transistor) or 24 VDC input from other flow computer working in pair in hot/stand-by mode.

The terminals are marked:

- +S + signal
- S- signal

I/O board connectors

The backplane has one 25-pin female D-type connectors for field wiring for each I/O board. See the pin assignment of the connector for each type of the boards in the Annex B

5.3 Start-up

After the UNIFLOW-200 has been wired for power and external devices, it may be activated by energizing the external power supply. When power is applied, the unit displays the

message Load in progress... Please be patient.

After about 1 minute the operating system of the unit starts testing the internal parameters and displays messages indicating whether the parameters pass or fail the test. If some of the parameters are missed or damaged the default parameters are activated.

After the tests the blinking message **Restarted!** appears on the display together with the date and time of the restart and with the current date and time.

There is also a message informing operator if the test of parameters was successful or the test failed and default parameters were activated.

After pressing any key the main menu appears on the display.

If after the start-up the unit displays messages **Parameters are damaged!** and **Check parameters!** then it is necessary to enter the Parameters menu and set the parameters required for the particular application. Before setting up the proper parameters the unit will not start the normal operation, i.e. will not start to perform the measurement. See the setup procedure in the Section 9.

If after the start-up the unit displays messages **Parameters are OK!** then it starts the normal operation, i.e. it will perform the measurement even if the blinking message Restarted! is seen on the display.

CAUTION

If the operating conditions and the parameters of the application were not provided to the manufacturer then UNIFLOW-200 is supplied from the factory with all the input and output channels inactive and all the metering streams are disabled. It is part of the start-up procedure to setup the unit for the particular application. See the setup procedure in the Section 9.

5.4 Start and stop metering streams

Once the metering stream is properly configured it starts the flow calculation and never stops.

When operator modifies any parameter and leaves the Parameters menu the flow calculation is interrupted for few calculation periods while the new parameters are checked.

The metering stream operation can be suspended if in the parameter setup the fluid or the flow meter set to None (see section 9).

6 Basic operation

The operation of the UNIFLOW-200 is accomplished through an operator interface comprising an LCD display and a keypad. The layout of the front panel is shown in figure below.

UNIFLOW		tifunction Flo	ow Computer	Ç⁄]		ower Run	Alarm	
[m³/h]	. flowi ′ flowi	6 822.	1079	7	Exp	8 abc	9 ^{def}	Esc	
[GJ/h		327. sure	.8373 .9869	4	ghi	5 ^{jkl}	6 ^{mno}	Clear	
	→		Henu A	1	pqrs	2 ^{tuv}	3 ^{wxyz}	Alt	
FI	F2	F3	F4	٥	-	0	- **/	Enter	

Figure 6-3 Front panel

6.1 Keypad

There are 20 keys located on the keypad grouped into 3 functional groups.

6.1.1 Numeric keys

The numeric keys offer the full number set (0 - 9), decimal point (.), and a minus (-) key. They used to enter or change data.

Each numeric key has secondary characters assigned to them.

They are as follows:

Numeric 1 to 8 – alphabetic letters from A to Z and from A to Я (Cyrillic letters)

Numeric 0 – space ()

Numeric 7 – Exponent (Exp)

Decimal point (.) – opening (() and closing ()) bracket

Minus sign (-) – plus (+), multiply (*) and divide (/) sign

The secondary characters activated by repeated key press.

For example, pressing the key 9 repeatedly the characters in the input field appears in the following order: 9 D E F É d e f é \square E % 3 \square e # 3. Both uppercase and lowercase letters can be entered this way.

Letters and special characters are used to

- enter text information (e. g. the name of the metering stream)

- enter equation in virtual stream definition (see Section 9.)

Exponent key is used to enter quantities in scientific notation. The exponent field is activated by pressing Alt key then Exp key. Letter "e" appears in the input field indicating that the exponent part of the number to be entered. Exponent key available only for the parameters which value in decimal notation exceeds the space available in the input fields.

6.1.2 Editing keys

Esc key

• pressing Esc key while editing any data entry field causes the editing stopped, the entered numbers or the selection mode is ignored and the original value of the field is restored;

 pressing Esc key while data page is displayed (and no any data entry field is being edited) causes exit from data page to the parent menu. All the modifications done after the last pressing of the Save key will be ignored and the original values of the data fields will be restored.

Clear key

Alt key

- pressing Clear key while editing any data entry field causes the last character entered is cleared.
- Alt key is used in conjunction with the Exp key to enter number in exponential format.

Enter key

Enter key is used to finish the data entry and data selection in the data entry fields. Pressing Enter do not causes the
entered data is activated. To activate the data the Save key shall be pressed and the Parameters menu item shall
be left. Exiting from parameter menu the flow computer shows message Parameter update in progress. The modified
parameters will be used in flow calculation after the message disappears.

6.1.3 Function keys

There are four function keys located below the display and marked with F1, F2, F3 and F4.

The function keys have no one single particular function. They are multi-functional keys. The valid functions of the keys at each particular display page are indicated in the bottom line of the display.

The function keys are to navigate in the menu tree and select parameters or data items to view, change or save.

The functions of the keys are as follows:

- ⇐ left arrow
 - move to the previous (upper) level of menu tree or return to the parent menu from the data page
- ⇒ right arrow
 - move to the next (lower) level of menu tree
 - enter into data page if there is no more menu tree level
- û up arrow
 - move by one item up in the menu list (on the menu page) or data list (on data page)
- 4 down arrow
 - move by one item down in the menu list (on the menu page) or data list (on data page)
- 1 up-down arrow
 - scroll through the menu items or data pages. After the last menu item or data page the first one appears.
- ⇔ left-right arrow
 - move to the next data entry field. After the last field the cursor jumps to the first field.

Save

• save the data on the data page displayed and return to the parent menu

Change

- in the numeric entry field: clears the content of the field and enters the field for editing
- in the selection entry field: pressing Change key repeatedly the option list for the selection scrolls in the selection field. Press Enter when the desired option is displayed to make your selection.

Menu

leaves the data page and return to the parent menu

OK

confirm the selection of the highlighted item

6.2 Display

The 320 x 240 dots backlit TFT color LCD display offers 14 lines of information displayed as alphanumeric and graphical characters.

There are two different types of display pages available in the UNIFLOW-200:

• menu page

The left pane of the menu page shows the menu tree levels the operator went through to arrive to the current position. The right pane shows the available menu items for selection. Press 1 and 1 key to highlight the desired menu item. Press \rightleftharpoons key to enter the next menu level or to data page. Press \Leftarrow to return the previous menu level. The figure below shows an example of the menu page

Main menu Flow Streams	Summary display -Periodic totals -Flowrates -Cumulative tot. Premium totals -Fault totals -Process data -Summary disp.2 -Summary disp.4

Figure 6-4 Menu page

data page

The data page is a list of parameters. The description, the value and the unit of measurement of the parameters are shown.

Press \hat{T} and \hat{V} key to highlight the desired data item.

Press Change key to start editing the numeric entry field.

Press Change key repeatedly to scroll through the available options of the selection entry field.

Press OK key to confirm the numeric value entered or the selection highlighted.

Press Save key to save the new value of the parameter and return to the parent menu.

Press Esc key if you want to discard the editing you have done and return to the parent menu.

The figure below shows an example of the data page.

01.Str.ASZK1	
Fluid	natural gas
Base temperature	15 °C
Base pressure	1.01325 bar
Combust.ref.temp.	15 °C

Save Change	

Figure 6-5 Data page

NOTE

Each page consists of 15 lines.

First line shows the stream identifier string.

Last line shows the function pictogram of the F1 - F4 function keys.

13 data lines can be seen on the screen. If more then 13 data items to be displayed scroll through the data lines with \hat{u} and \hat{v} keys.

6.2.1 Navigating the display

From the main menu select the item you require by pressing \hat{U} and \hat{V} keys. Press \Rightarrow key to enter the next menu level. Select the required sub-menu item by pressing \hat{U} and \hat{V} keys and press \Rightarrow key to enter the next sub-menu level. Repeating this procedure, you arrive to the required data page. Navigating in the menu tree you can see the menu and sub-menu items passed on the left pane of the display.

Pressing <= key returns to the previous menu level.

6.3 Data security

6.3.1 Hardware write lock switch

Flow computer has a hardware write lock switch.

The write lock switch located on the base plate as shown on the picture below.

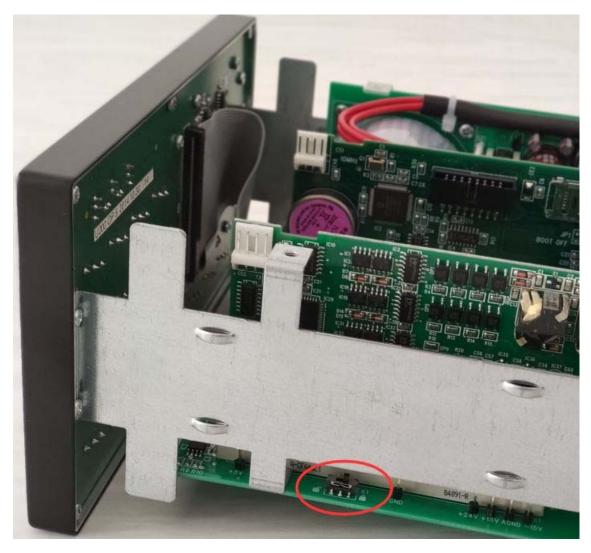

Figure 6-6 Hardware write lock switch

The write lock switch is accessible after pulling out the display from the housing together with the internal frame holding the PCBs. The housing is fixed to the internal frame by means of 2 screws on the back of the unit. Under one of the screws sealing cup is mounted. After fixing the screw the cup is filled with sealing wax (picein) and marked with the stamp of organization (authority) responsible for sealing the unit.

If the unit is sealed the write lock is accessible only after breaking the seal.

The write lock switch has two positions:

In open position there is no restriction on the firmware update and parameter download or modification. In closed position firmware update is not allowed, parameter project download is not allowed and parameter modification is not allowed. The parameters still can be checked on the display, like at Guest software security level and can be uploaded from the flow computer.

The status of the write lock switch can be checked on the display shown below.

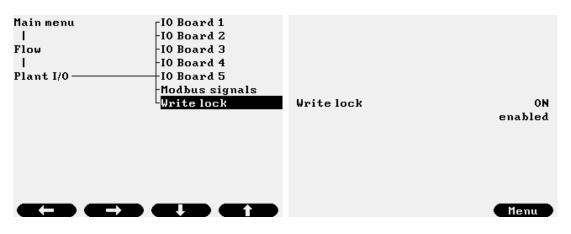

Figure 6-7 Write lock switch status

Entering Parameters menu with write lock active, message will appear on the display as shown below, warning the operator about the active write lock.

	Main menu ———	——-Flow

Figure 6-8 Write lock message on display

If the operator does not accept the restriction the position of the switch shall be checked.

If the write lock switch is in locked position, it shall be switched to unlock position. Modification of the parameters will be allowed after that.

If the write lock switch is in unlocked position, but the flow computer reports restriction then the manufacturer shall be contacted for assistance.

Trying to update the firmware or download parameter project via the ToolBox software warning message will appear on the ToolBox screen and the update or download will not happen.

6.3.2 Enabling write lock switch

The flow computer is supplied from the factory with write lock switch disabled by default. The status will be as can be seen on the picture below-.

Main menu Flow Plant I/0	IO Board 1 -IO Board 2 -IO Board 3 -IO Board 4 IO Board 5 -Modbus signals Write lock	Write lock	OFF disabled
			Menu

Figure 6-10 Write lock switch status by default

The write lock switch shall be enabled before it performs the function described in par. 6.3.1. To enable write lock switch navigate to the page Calibration/Write lock switch

Main menu Calibration	Transm. calibr. Write lock switch		
		Write lock:	enabled
C-D C-D		OK Change	Cancel
	Write lock switch will be enabled. The write lock switch cannot be disabled once is it enabled. UNIFLOW-200 will be write protected when the write lock switch is in ON position and will not be write protected when the write lock switch is in OFF position.		
	Do you want to enabl Are you sure to enab	e the switch? yes le the switch? yes	
	OK Change	Cancel	

Figure 6-11 Enabling write lock switch

Change the status to enabled by clicking Change button and press OK.

Warning message will be displayed. After you confirm twice your intention to enable the write lock switch it will be enabled. Caution!

Once the write lock switch enabled it cannot be disabled.

6.3.3 Software security levels

If the hardware write lick is open the data are still protected with password in the flow computer.

There are three security levels. Each of them has its own password. Depending on the security level the operator logged in he/she has the right to modify different groups of parameters.

At Engineer level both the Operator and Engineer password can be modified.

CAUTION

The flow computer shipped with empty password list. It means that pressing Enter when the flow computer requires password you log in at Engineering level allowing modification all the parameters.

Set your own Operator and Engineering level password to protect the parameters against undesired modification. The procedure for password setting is described in Section 9.

Remember the password you entered. If you forget your password you will have to ask the assistance of the manufacturer or you have to return the unit to the manufacturer.

Guest level

At Guest level all the parameters can be reviewed at the display but no any modification is allowed.

The default password for Guest level is the Enter key. When the flow computer prompt for the password just press Enter key without entering any codes.

The Guest level password cannot be altered.

Operator level

At Operator level only the parameters listed in the Operator parameters submenu are available for modification. These parameters include the transmitter ranges, the high and low alarm limits and the keypad values. The default password for the Operator level is Enter (no password is set).

Engineer level

At Engineer level all the parameters are available for editing. The default password for the Engineer level is Enter (no password is set).

IMPORTANT

Once the operator logged in at Operator or Engineer level and the inactivity period (i. e. no any key is pressed) exceeds 2 minutes the flow computer automatically logs out the operator. This is to prevent accidental leaving the flow computer in the state where the parameters can be altered.

6.4 The menu system

The main menu consists of items as shown below.

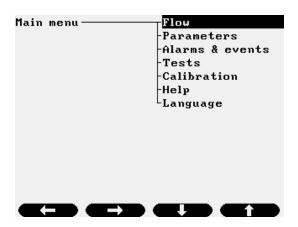

Figure 6-12 Main menu page

The menu items Flow, Alarms & events, Help and language selection (Magyar/English/Pyccкий/Română) are accessible without password.

In Flow menu the metering data are shown grouped into different submenus.

In Alarms & events menu, the list of unacknowledged and acknowledged alarms can be seen. The alarm log, event log and the downloaded gas composition log are accessible here also.

The menu items Parameters and Tests require password to enter for accessing.

The menu item Calibration is reserved for the manufacturer and for the authority calibrating the flow computer. It is accessible with special password only.

The menu item Language allows selecting the language the flow computer communicates with. Available languages are Magyar (Hungarian), English, Русский (Russian), Român (Romanian). Changing the language will change the language of the display, the alarm messages, etc. UNIFLOW-200 is a true multilingual flow computer.

6.5 Entering data

There are two different data types in the UNIFLOW-200.

Numeric data can have any numeric value the operators enter (within the limit of the applicable standard). An example of such value is the orifice bore diameter.

Selection data can have value selected from a list of options.

An example of such value is the differential pressure tapping location of the orifice meter. It can be selected from a list comprising corner, flange or D and D/2 tapping.

Changing the value of numeric data or selection of any displayed parameter is straightforward with the UNIFLOW-200.

6.5.1 Changing numeric data

Locate the parameter to be changed in the Parameters menu navigating to the appropriate data page. Entering into Parameters menu key in the password corresponding to the security level the desired parameter can be changed.

Select the parameter on the data page using $\, {\rm th} \,$ and $\, {\rm lh} \,$ keys.

Press Change key and enter the new value. If necessary, you can edit the new data as you key it in. Use Clear key if you want to delete single figures or characters.

Press OK function key or Enter key to finish editing and accept the entered figures.

Pressing Esc key while editing causes the data entry process aborted and the original value of the parameter is restored.

Select the next parameter to be edited and repeat the procedure above.

When you finish the data editing on the data page press the Save function key to make your modification permanent. Pressing Save key saves the modified parameters and return to the parent menu from the data page.

If instead of Save key you press Esc key all the modification done on the data page are discarded. It causes the original values of the parameters are restored and return to parent menu.

6.5.2 Changing selection

Changing the selection is done in a similar way as changing the numeric data.

The only difference is that the list of available options for selection is scrolled through in the data entry field by pressing Change key repeatedly.

6.6 Data pages

The data pages are listed in the Section 9.

7 Maintenance and troubleshooting

In normal operating environment UNIFLOW-200 do not require any periodic maintenance. However, the real time IC (Dallas 12887) shall be replaced after 10 years of operation.

If the UNIFLOW-200 fails to start check the fuses.

There are three fuses located on the rear panel of the flow computer as shown on the figure below.

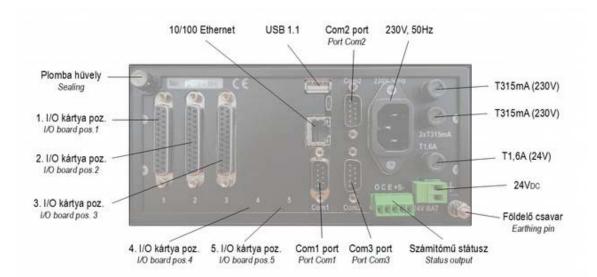

Figure 7-16 Fuses

Fuse F1 (T type 1.6 A) protects the 24 VDC power input. Fuses F2 and F3 (T type 315 mA) protects the 230 V 50 Hz power input.

CAUTION

Disconnect both 230 V 50 Hz and 24 VDC power inputs before the fuse replacement. Never use fuses with higher rating then it is recommended. It may cause damage of the instrument.

The signal on the input and output channels can be checked in the menu: Main menu – Tests – I/O board n, where n is the number of I/O board to be tested.

The data page of the I/O boards shows:

- current in mA for current input and current output channels;
- resistance for PRT/RTD channels;
- frequency and number of pulses received for pulse input channels;
- state (open or closed) for digital input and digital output channels.

8 Support

For convenience of operation software tool is available for UNIFLOW-200.

8.1 U200ToolBox

It is a Java based application running on PC consists of three tools.

8.1.1 UNISetup

General features of the UNISetup

- connects to UNIFLOW-200 on the Ethernet port;
- uploads application parameters from UNIFLOW-200;
- generates application parameters off-line;
- edits application parameters off-line;
- saves application parameters on the disk drive of the PC;
- downloads application parameters to UNIFLOW-200.

8.1.2 UNIArchive

General features of the UNIArchive

- connects to UNIFLOW-200 on the Ethernet port;
- uploads archive data files from UNIFLOW-200;
- saves archive data file on the disk drive of the PC.

8.1.3 UNIUpdate

- updates the firmware of UNIFLOW-200;
- update file and download code supplied by manufacturer.

See installation and operating instruction of the U200ToolBox in the help file of the software. U200ToolBox is available for download on the web site of manufacturer, <u>www.processcontrol.hu</u>.

9 Detailed operation – The menu tree

In this section, the data pages are described in detail. The order of data pages follows the menu structure.

9.1 Flow

In the Flow menu, the measured and calculated data can be called on the display. The data are grouped together on several submenu pages as described below.

No password is required to enter the Flow menu and to display any data.

No data modification can be initiated in the Flow menu.

However, commands required for certain mode of operation can be entered.

Such commands include:

- flow meter serial test start and stop command
- batch control start and stop command

9.1.1 Stream data

9.1.1.1 Summary display 1, 2, 3 and 4

Route in the menu tree:

Main menu	Submenu 1	Submenu 2	Submenu 3
Flow	Streams	Summary display	data page (1.1.1)
		Summary display 2	data page (1.1.8)
		Summary display 3	data page (1.1.9)
		Summary display 4	data page (1.1.10)

The summary displays collect together the most important metered and calculated data for each metering stream. The data items to be shown on the summary displays are editable. They can be edited in the menu:

Main menu	Submenu 1	Submenu 2	Submenu 3	Submenu 4	Submenu 5
Parameters	General data	User defined	Display	Summary display	data page (2.3.3.1.1)

The operator can modify the default display or build a very new one most suitable for the particular application.

There are four summary displays available in the flow computer.

Summary display 1 has the default content as shown in the figure below.

Summary display 2 shows the same data as summary display 1 but with double sized characters for better visibility. This is the default display page appearing on the display if no any key is pressed on the keypad for more then 2 minute.

Summary display 3 shows the previous month data by default. Summary display 4 shows the current month data by default.

The operator can create his own set of displayed data here if desired.

01.Str. M1	
CVOL flowrate	4.065.8723 m³∕h

9.1.3 Archive data

Route in the menu tree:

Main menu	Submenu 1	Submenu 2	Submenu 3
Flow	Archived data	Periodic totals	data page (1.3.1)
		Batch data	data page (1.3.2)

UNIFLOW-200 has an extensive data archive.

The archived data divided into two subgroups:

- archived periodic totals;
- archived batch data;

The most convenient way to access the archived data is to read them via the Ethernet link by means of However all the archive data can be called on the display as well, if PC is not available.

UNIArchive software.

9.1.3.1 Archived periodic totals

The archive data data page is shown on the figure below.

01.Str. NGAS-ORIFICE

Figure 9-41 Archive data data page

Configured to display

- hourly totals for volume at base conditions;
- hourly average of the gauge pressure;
- hourly average of the temperature

The totals are displayed for 19 October 2010 for the hours from 7 to 14.

Data are displayed in three columns preceding with serial number of the periods in the first column.

The selection of the data to be displayed and the time period is done by the function keys as described below.

Press \Leftrightarrow key to select the field to be edited. Press $\hat{1}$ key to scroll through the items from selection list in the data field or press Change key to enter the numeric fields. The editable fields and their values are as follows.

- stream number from 01 to 12
 - period field: hourly, shift, daily, multi day, monthly
- date field: yyyy mm dd
- variable name field:
 - o CVOL m³ (volume at base conditions);
 - o UVOL m³ (volume at line conditions);
 - o MASS kg(mass)
 - o ENGY GJ (energy)
 - o CO2MASS kg (mass of CO2 emission)
 - o RAW UVOL m³ (volume at line conditions before applying any error curve correction);
 - o Temp. °C (temperature)
 - o dP mbar (differential pressure)
 - o fltCVOL m³ (fault volume at base conditions);

- o fltUVOL m³(fault volume at line conditions);
- o fltMASS kg (fault mass);
- o fltENGY GJ (fault energy);
- o PressG bar (gauge pressure);
- o Dens. kg/m³ (line density);
- o Rel.Dens. (relative density);
- o premCVOL m³ (premium volume at base conditions);
- o premUVOL m³ (premium volume at line conditions);
- o premMASS kg (premium mass);
- o premENGY GJ (premium energy);
- o PressA bar (absolute pressure);
- o K(Z1/Zb) (ratio of the compression factor at line conditions to base conditions);
- inf.cal MJ/m³ (inferior calorific value);
- o sup.cal MJ/m³ (superior calorific value)
- o No of cycl. (number of calculation cycles;
- variable type subfield:
 - For totals this subfield can be selected as:
 - o total (displays the period counter for the selected period);
 - min. (displays the minimum flow rate for the flow corresponding to the total, e.g. minimum mass flow rate for the mass total);
 - max. (displays the maximum flow rate for the flow corresponding to the total, e.g. maximum mass flow rate for the mass total);

For non total variables this subfield can be selected as:

- o average (displays the average value of the variable for the selected period);
- o min. (displays the minimum value for the selected variable in the selected period);
- o max. (displays the maximum value for the selected variable in the selected period);

Press OK key after all the selection is done.

The data are displayed on the screen and the first data line is highlighted.

Press \mathbb{Q} and $\hat{\mathbb{Q}}$ keys for scrolling through the data lines.

Press \Leftrightarrow key for selecting the editable fields to select different data for different periods to be displayed.

Press Menu key to return to the parent menu.

Function of the F keys on the Archive data page:

- ⇔ select the next field for editing
- select he data item in the field being edited
- **OK** confirm the selection and display the data
- select the next data line
- f select the previous data line

Figure 9-43 Modbus registers data page

First the port has to be selected.

Available options are: Ethernet, Com1, and optionally from Com2 to Com8, depending the number of serial extension module/board installed.

Once the port is selected the Port function is displayed automatically as set-up in the "Interfaces" menu (see 9.2.4.). The starting register to be displayed can be entered.

Pressing the Data key, the content of the registers displayed in hexadecimal and decimal format. The number format (short integer, integer, float) displayed as well.

See the register maps for different Port functions in Section 11.

Function of the F keys on the Modbus registers data page:

- ⇔ select the next field for editing
- select he data item in the field being edited
- OK confirm the selection and display the data
- select the next data line
- 爺 select the previous data line

Menu returns to the parent menu.

9.1.5 Data transfer

Route in the menu tree:

Main menu	Submenu 1	Submenu 2
Flow	Data transfer	data page (1.5)

The most convenient way to access the archived data of the UNIFLOW-200 is to read them via the Ethernet link by means of UNIArchive software. If this method of accessing the files is not available for some reason then data retrieval (sending data files to the serial or USB port) can be initiated in this menu.

There are several archive files available in the UNIFLOW-200. All of them can be sent to the serial or USB port, however not all of them are optimized for printer.

The reports Month (short daily) and Month (short hourly) are optimized for printer. The delimiter character is space in theses files and they can be printed on standard 80-character wide printer.

The rest of the files have semicolon delimiter character and they are wider then 80 columns. They can be caught on the serial or port of PC by some terminal program and saved on the hard disk for further evaluation or can be written to pen drive on the USB port.

The archive data files sent to the serial or USB port make use of UTF8 encoding. To display the archive data file on external device it shall be set accordingly. Otherwise some of the characters on the reports might not be displayed properly.

The data transfer data page is shown on the figure below.

```

- o Web defined report 18
- Monthly batches;
- Meter serial test;
- Snapshot;
- Logs;
- Parameter project;
- Comm. monitor logs;
- FC calibration report;
- Month. Select the month for which the report to be transferred.
- Start. Select value "Yes" for this field to initiate file sending

There are separate short reports for each metering stream (from 01 to 12). Reports for all streams will be sent out once the Start is selected. Reports denoted with asterisk (*) (short type reports) are available only for metering streams where the fluid is natural gas. The non-short reports include data for all the streams.

Sample of the different short reports are shown in Annex A.

Function of the F keys on the Data transfer data page:

select the next field for editing

select the previous field for editing

Change modify the selected data field

OK Confirm the selection

Menu returns to the parent menu.

9.1.6 Extra summary display

Route in the menu tree:

Main menu	Submenu 1	Submenu 2	Submenu 3
Flow	Extra sum. display	Extra sum. disp1	data page (1.6.1)
		Extra sum. disp2	data page (1.6.2)
		Extra sum. large1	data page (1.6.3)
		Extra sum. large2	data page (1.6.4)

There are two extra summary displays available in the UNIFLOW-200. Both of them can be displayed with double sized characters as well.

The main difference between the summary display and extra summary display is that on the extra summary display data from different metering streams can be grouped together. In case of multi stream application it helps the operator to overview the desired data from different streams on one single display.

Figure 9-48 Batch display for pipeline interface batch

For each stream configured the status of the batch measurement is indicated in the top line of the display as in progress or stopped.

The lower part of the display shows the batch data for the stream being highlighted as follows:

- batch identifier
- product information
- batch start time
- batch stop time
- nine selected measured batch variable

The displayed measured batch variables are selectable by the operator from the list:

- Mass kg (mass batch total);
- CVOL (volume at base conditions batch total);
- UVOL (volume at line conditions batch total);
- CVOL flowrate (volume at base conditions flow rate)
- UVOL flowrate (volume at line conditions flow rate)
- Mass flowrate (mass flow rate)
- Line pressure;
- Line temperature;
- Line density;

- Base density;
- Dens.met.body T (density meter body temperature);

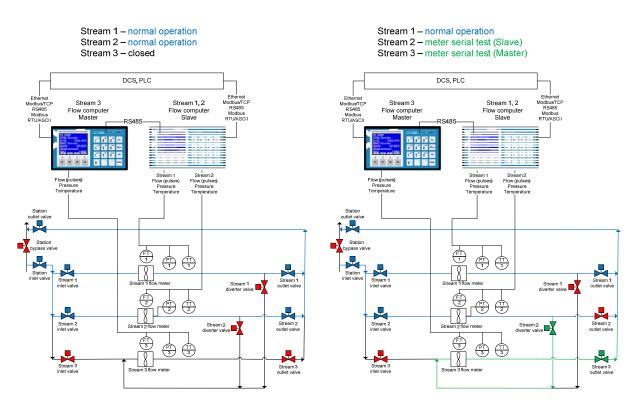

To display the archived batch data see 9.1.3.2.

9.1.8 Flow meter serial test and flow computer calibration

Route in the menu tree:				
Main menu Submenu 1 Submenu 2				
Flow	Meter serial test	data page (1.8)		

9.1.8.1 Flow meter serial test

The flow meter serial test measurement was designed for testing two flow meters connected in series as shown on the figure below.

Figure 9-49 Flow meter serial test measurement

By opening and closing the appropriate valves flow is directed through both meters M1 and M3 or M2 and M3. Quantities measured in the stream being connected in series during the pre-programmed test duration are compared and the deviation is determined.

The meter serial test measurement assumes that:

- separate UNIFLOW-200 flow computers are connected to the Master meter and to the meters under test (Slave meters);
- stream 1 to stream 4 are available for configuration if meter serial test is enabled in both Master and Slave flow computers;
 stream 5 to stream 8 are used as shadow streams;
- during the serial connection of the meters the fluid is measured twice. Not to account these quantities twice one of the flow computers shall be set as "custody transfer stream" and the other as "non custody transfer stream". In the "non custody transfer stream" flow computer the calculation is performed in stream 5 to 8 (shadow streams).;
- two flow computers shall be connected via serial port. In the "non custody transfer stream" flow computer the serial port function shall be set as "Serial test Master", while in the "custody transfer stream" flow computer the serial port shall be set as "Serial test Slave".
- the serial test measurement is enabled in the Stream setup menu. See in 9.2.2.1.3.

NOTE

UNIFLOW-200 will not perform any valve control to establish the serial connection of the meters. The appropriate valves shall be controlled manually or by some supervisory system.

UNIFLOW-200 configured as master in communication will read the data from the slave UNIFLOW-200 measured during the serial test and prepares a serial test comparison report.

The progress of the meter serial test measurement can be monitored and the results of the last test can be displayed on the meter serial test display as shown below.

Function of the F keys on the Meter serial test data page
select the next field for editing
Change modify the selected data field
OK Confirm the selection
Menu Returns to the parent menu.

The data fields on the data page are as follows:

• Meter serial test;

o meter serial test; (not editable, set in the stream setup menu)

Stream;

o non cust.tr.str.(master);

- (not editable, set in the stream setup menu)
- o cust.tr.str.(slave); (not editable, set in the stream setup menu)
- Tested stream (slave) (displayed in master device only;
 - modbus address; (selected from the list (available for the serial test Slave flow computers), set in the com port setup menu)
 - o stream number; (selected from the available in Slave device streams, from stream 1 to 4)
 - o name; (not editable, name of the stream set in the slave device and read by Master device)

Test duration;

Numeric entry. Enter the duration of the serial test. Valid entry is from 2 to 120 minutes.

• Test command;

Display the status of the test process and this is also the command entry field. Statuses:

- o idle; (no test in progress)
- o in progress; (test in progress)
- Master com.param.error; (in Master device only. No com port is configured as Serial test Master)
- Slave com.param.error; (in Slave device only. No com port is configured as Serial test Slave)
- Communication error; (no communication with the other device) Moving the cursor with down arrow key until this field is highlighted, commands above the function keys F1 to F4 appear as follows:
- o start; (start the serial test, in Master device only)

- stop; (stop the serial test, in Master device only. If stop command is selected the test will be interrupted at the end of next minute and the data will be evaluated);
- o abort ; (abort the serial test. If abort command is selected the test will be interrupted immediately and the data will not be evaluated.
- Test started;
 - Start time of the meter serial test.
- Test stopped;

Stop time of the meter serial test. The last two lines show three of the measured values.

The displayed values are selectable by the operator from the list:

- UVOL m³ (volume at line conditions);
- CVOL m³ (volume at base conditions);
- Mass kg (mass);
- ENGY GJ (energy);
- PressG bar (gauge pressure);
- PressA bar (absolute pressure);
- Temp. oC (temperature);
- ZI (compression factor at line conditions);
- Zn (compression factor at base conditions);
- Rel.Dens. (relative density);
- Base.D kg/m³ (base density);
- Dens. kg/m³ (line density);
- ICV MJ/m3 (inferior calorific value);
- dP mbar (differential pressure);
- UVOL FR m³/h (volume at line conditions flow rate);
- CVOL FR m³/h (volume at base conditions flow rate);
- MASS FR m³/h (mass flow rate);
- ENGY FR m³/h (energy flow rate);

The control of the serial test can be accomplished via keypad or from the supervisory system (DCS, PLC, etc.) via the User Modbus table (see Annex C for User Modbus editor).

In the Master flow computer control registers can be defined as follows:

- Test duration write the required test duration in minutes;
- Start command write 1 into the register to start the test
- Stop command write 1 into the register to stop the test at the end of current minute
 - write 2 into the register to abort the test
- S/N of the Slave device write the serial number of the Slave device as listed in the Meter serial test Master com port definition screen;
- S/N of the Stream write the serial number of the stream in the Slave device measuring the stream being connected in series with the Master stream;

Measured data in the Master device, measured data in the Slave device and their deviation can also be assigned to Modbus registers and can be read via port the User Modbus table is assigned to.

In the Slave flow computer, the measured data can be assigned to Modbus registers.

In addition, the Meter Factor (MFactor) of the pulse input channel assigned to the Slave stream being tested can be assigned to Modbus register.

Some supervisory system can run several serial test runs and can determine new Mfactor for the Slave stream.

The new Mfactor can be written into the defined register.

Warning message will appear on the screen of the Slave machine, asking the Operator accept the new MFactor.

If Operator accepts the new MFactor, the appropriate parameter of the pulse input channel assigned to the stream being tested will be updated. Operator can also refuse the new MFactor.

The results of the serial test are stored in Meter serial test report. The last 10 reports are retained in the archive of the flow computer.

The Meter serial test reports can be retrieved with UNIArchive software tool.

They can also be transferred to flash drive via the USB port of the flow computer. See 9.1.5. Sample report is shown in Annex A.

9.1.8.2 Flow computer calibration

The flow computer calibration function is a subset of the flow meter serial test. The function of Uniflow-200 in the flow computer calibration explained in the figure below.

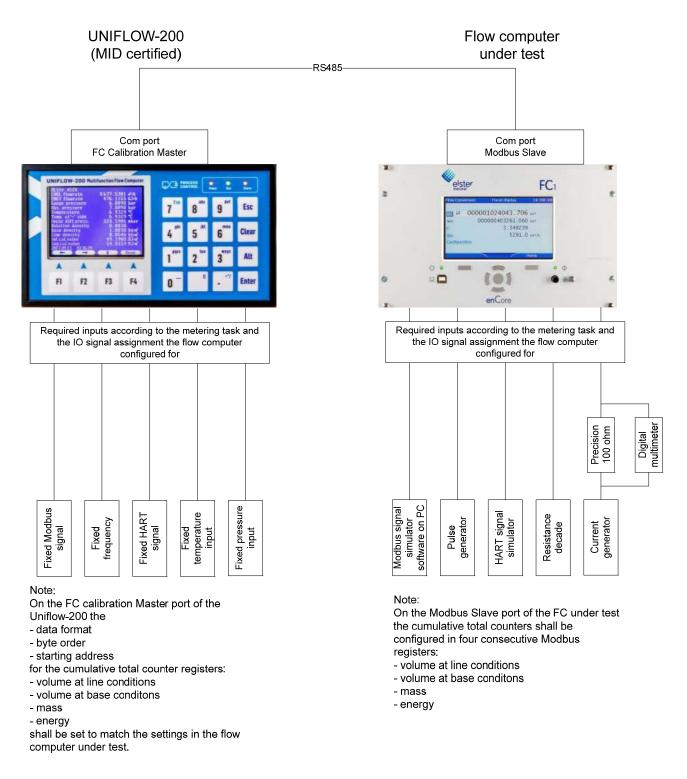

Figure 9-51 Flow computer calibration

Uniflow-200 and the Flow computer under test shall be configured to perform exactly the same metering task (fluid, flow meter, input signals, etc.).

In Uniflow-200 in the stream setup menu the transmitter calibration shall be enabled and the flow pressure and temperature signal shall be set up for the values corresponding to the desired test point.

Input signals for the flow computer under test shall be provided from the appropriate signal generators or simulators.

During the flow computer calibration test Uniflow-200 continuously reads UVOL, CVOL, MASS, ENGY cumulative total counters from the flow computer under test. After the test finished it calculates the total increments of UVOL, CVOL, MASS and ENGY in the flow computer under test as difference between the counter positions at stop and at start signal. Uniflow-200 performs also its own flow calculation and totalization during the test.

At the end of the test Uniflow-200 records its own and the flow computer under test quantities in the FC calibration data reports and also calculates the difference between the quantities.

The flow computers are connected via RS 485 port.

Port function in Uniflow-200 set to FC calibration Master (see 9.2.4.1.) and port function in the flow computer under test shall be set to Modbus Slave.

The flow computer calibration starts and the progress is monitored on the Meter serial test display as can be seen below.

Abort Interrupt the test being in progress and discard the results, no report generated

Stop Stop the test being in progress at the end of the current minute (not waiting for the test duration expired), results are evaluated and report is generated

OK Confirm the selection

Menu Returns to the parent menu.

The data fields on the data page are as follows:

- Meter serial test;
 - o flow computer calibration; (not editable, set in the stream setup menu)
- Stream;

o non cust.tr.str.(master);

(not editable, set in the stream setup menu)

o cust.tr.str.(slave); (not editable, set in the stream setup menu)

• Tested stream (slave);

o modbus address; (not editable, set in the com port setup menu)

- Test duration; Numeric entry. Enter the duration of the serial test. Valid entry is from 2 to 120 minutes.
- Test command;

Display the status of the test process and this is also the command entry field. Statuses:

- o idle; (no test in progress)
- o in progress; (test in progress)
- Master com.param.error; (in Master device only. No com port is configured as Serial test Master)
- Communication error; (no communication with the other device) Highlighting this field command can be selected as follows:
- o start; (start the serial test, in Master device only)
- stop; (stop the serial test, in Master device only. If stop command is selected the test will be interrupted at the end of next minute and the data will be evaluated);
- o abort ; (abort the serial test. If abort command is selected the test will be interrupted immediately and the data will not be evaluated.
- Test started;

Start time of the meter serial test.

• Test stopped;

Stop time of the meter serial test.

The last four lines show three of the measured variables.

The displayed values are selectable by the operator from the list:

- UVOL m³ (volume at line conditions);
- CVOL m³ (volume at base conditions);
- Mass kg (mass);
- ENGY GJ (energy);

In the upper lines the totals calculated in Uniflow-200 are displayed.

In the last line the counters read flow the flow computer under test are displayed.

The results of the serial test are stored in FC calibration data report. The last 10 reports are retained in the archive of the flow computer.

The FC calibration data reports can be retrieved with UNIArchive software tool.

They can also be transferred to flash drive via the USB port of the flow computer. See 9.1.5. Sample report is shown in Annex A.

9.1.9 PID

See in Section 9.2.7.

9.2 Parameters

This chapter guides through the steps required to setup the UNIFLOW-200 for a particular flow measurement task. It gives the full list of options available for selection in the setup procedure.

UNIFLOW-200 is true multi-function flow computer. Its capabilities allow configuring it for very wide range of applications. As a consequence, the flow computer should be setup for each particular application. The setup is done in the Parameters menu.

Generally, the setup is required only before the start-up of the unit. However, modification of the parameters may become necessary during the normal operation of the flow computer as well. E. g. changing of the orifice bore diameter in case of orifice plate replacement, or, changing the turbine meter K-factor if the turbine meter is replaced are part of the normal daily operational procedure.

The setup can be done via keypad and display. The UNISetup software is also available at the web site of the manufacturer for download making the setup even more convenient and user friendly.

Entering the Parameters menu requires password. Logging in on Operator security level allows modification of limited set of parameters only. At Engineer level all the parameters are alterable. If operator logs in at Guest level then no parameter modification is allowed but all the parameters can be reviewed.

The signal processing and the flow calculation are not interrupted during the parameter editing.

- In the editing procedure:
 - **OK** key accepts the new value of the parameter
 - Save key stores the new value in a temporary location

The modified new parameters become active (i. e. the flow computer takes their value in the flow calculation) after the operator left the Parameters menu. Message "Parameter update in progress" is shown on the display when new parameters are activated.

The general rules of navigating the menu and editing data see in the Chapter 6.

It is recommended to setup the parameters in the orders as described in this chapter.

9.2.1 I/O signal setup

Route in the menu tree:								
Parameters		I/O signals	I/O board m	Channel n	data page (2.1.m.n)			
where:	т	serial number of I/O bo	bard					
	п	serial number of chan	nel on the board m					

There are 5 slots in the flow computer capable to accommodate any type of I/O board available.

The setup parameters depend on the type of channel being configured. For example the analog input channel is configured in the same way regardless of its location on the ANI8 or ANI4PT2 board.

The physical parameters of the flow measurement and the input and output channels are not hard wired together in the flow computer. It is part of the setup procedure to assign the physical parameter (for example pressure) to the channel where the pressure transmitter signal is wired to (for example channel 1 on board 1).

The figures below show the settings for each type of channels.

First line of each data page indicates the number of board and channel being edited and the type of the I/O board.

CAUTION

If the channel status is inactive then the channel can not be used in the flow calculation even if you set all the parameters of the channel.

Do not forget to set the channel active if you want to use the signal measured at the channel in the flow calculation.

9.2.1.1 Analogue (4-20 mA) input channel

The analogue (4-20 mA) input channel data page is shown on the figure below.

Function of the F keys on the analogue (4-20 mA) input channel data page

- select the next field for editing
- f select the previous field for editing

⇒ remove the highlighted item from the eventing list and step to the next item

- Change modify the selected data field
- **OK** Confirm the selection
- Save save the selected/entered data and returns to the parent menu.

Figure 9-54 Error curve data page for flow rate signal

Error curve is available for the signals representing:

- volume flow rate at line conditions expressed in m3/h, MCF/h, CF/h, bbl/h
- mass flow rate expressed in kg/h, lb/h, Mlb/h

If the error curve correction is selected for the flow rate signal then new data page opens for entering the error curve points. The volume flow rate at line conditions (in m³/h) or mass flow rate and the error at that flow rate shall be entered from the calibration certificate of the flow meter. Maximum of 16 error curve point can be entered.

The flow rates shall be entered in increasing order.

- o Pressure;
 - mbar
 - bar
 - kPa
 - MPa
 - mmH2O

- PSIA or PSIG – depending on the gauge/absolute pressure transmitter selection supplementary parameter: type of transmitter

- ➢ Gauge pressure
- > Abs. pressure

o Temperature;

- °C
- °F
- Density;
- kg/m³

0

- lb/CF
- RD

supplementary parameter: type of transmitter

- Line density
- Base density
- Relative density (unit changes to (none) for relative density)
- o Special (special signal);
 - %
 - mole%
 - - (none)
 - MJ/m³
 - MJ/ka
 - uS
 - BTU/SCF
 - lb/MMSCF
- o Kin. viscosity (kinematic viscosity);
 - mm^2/s
 - cSt
- o Level;
 - m
 - cm
 - mm
 - inch

supplementary parameters

- Level equivalent (in level unit/mA)
- Zero level (in level unit)

Common parameters for input channels regardless of the signal type

- LO_current (low scale of the current input);
- HI_current (high scale of the current input);
- LO_scale (low scale of the parameter in engineering unit);
- HI_scale (high scale of the parameter in engineering unit);
- LO_limit (low alarm limit);
- HI_limit (high alarm limit);
- LOLO_limit (low-low alarm limit);
- HIHI_limit (high-high alarm limit);
- Keypad value; Keypad value is not available for differential pressure, flow rate and level signals. See the activation of the Keypad value in section 9.3. Alarm and events
- Event at;

It can be selected here that which of the events shall initiate an entry in the event log file of the flow computer and which of the events shall generate event in the alarm system. The options are:

- o lsc (low scale);
- o hsc (high scale);
- o lo (lo limit);
- o hi (hi limit);
- o lolo (lolo limit);
- o hihi (hihi limit);
- Log;
- Eventing;

Selecting y(yes) in the "Log" line causes an entry shall be generated in the log file.

Selecting n(no) in the Log line causes no entry is generated in the log file. In this case no y(yes) can be selected in the "Eventing" line

If in the "Log" line y(yes) is selected, then in the "Eventing" line y(yes) or n(no) can be selected, i.e. the operator can decide if the event generates event in the alarm system or not.

- Signal status
 - o active;
 - o inactive;

The input channels on the DEI4 I/OI board (input for transmitters communicating with Honeywell DE protocol) shall be setup in the same way as analogue (4-20 mA) channels with exception that no LO current and HI current parameters are available for these channels.

IMPORTANT

If the signal configured for any channel is to be used in flow calculation then the unit of measurement shall be selected as follows:

In case of metric unit system: bar

- pressure signal:
- differential pressure signal: mbar ٥C
- temperature signal:

In case of imperial unit system for gas measurement:

- PSIG or PSIA pressure signal:
- inH2O differential pressure signal:
- temperature signal: ٥F

9.2.1.2 **PRT/RTD** input channel

The PRT/RTD input channel data page is shown on the figure below.

Function of the F keys on the PRT/RTD input channel data page

- Û select the next field for editing
- Û select the previous field for editing
- ⇔ remove the highlighted item from the eventing list and step to the next item
- Change modify the selected data field

confirm the selection OK

Save save the selected/entered data and returns to the parent menu.

The editable fields on the data page are as follows:

- Signal name
 - Any character string up to 18 characters, for example: FIQ 501 temperature
- RTD type •
- Pt100 (100 ohms at 0 °C) default value Pt500, Pt1000 and Pt50 on special request; 0
- Unit •
 - °C
 - °F
- **RTD** calibrated?
 - yes; 0

If yes is selected then it is assumed that the Callendar - Van Dusen (CVD) coefficients are available for the sensor. In this case the CVD constants set to yes automatically and the R0, A, B and C can be edited.

0 no;

If no is selected then the default value of the CVD coefficients (from EN 60751) are used to convert the measured resistance to temperature. If CVD constants set to yes then R0, A, B and C are displayed but can not be edited.

- CVD constants (according to EN 60751);
 - o yes;

o no;

- R0 (at 0 oC), default value = 100;
- A, default value = 3.9083e-3;
- B, default value = -5.775e-7;
- C, default value = -4.183e-12;
- LO_scale (low scale of the parameter in engineering unit);
- Hl_scale (high scale of the parameter in engineering unit);
- LO_limit (low alarm limit);
- HI_limit (high alarm limit);
- LOLO_limit (low-low alarm limit);
- HIHI_limit (high-high alarm limit);
- Keypad value; see the activation of the Keypad value in section 9.3 Alarm and events
- Eventing;

It can be selected here that which of the events shall initiate an entry in the event log file of the flow computer and which of the events shall generate event in the alarm system. The options are:

- o lsc (low scale);
- o hsc (high scale);
- o lo (lo limit);
- o hi (hi limit);
- lolo (lolo limit);
- o hihi (hihi limit);
- Log
- Eventing

Selecting y(yes) in the "Log" line causes an entry shall be generated in the log file.

Selecting n(no) in the Log line causes no entry is generated in the log file. In this case no y(yes) can be selected in the "Eventing" line.

If in the "Log" line y(yes) is selected, then in the "Eventing" line y(yes) or n(no) can be selected, i.e. the operator can decide if the event generates event in the alarm system or not.

- Signal status
 - o active;
 - o inactive;

9.2.1.3 Pulse input channel

Depending on the selected signal type of the pulse input the physical parameter represented by the pulse and the data processing are different. The signal types are as follows:

• flow pulse;

Each pulse represents certain amount of fluid passed through the flow meter. The number of pulses is counted and converted into the totals with the K-factor of the flow meter.

flow check pulse;

This type of pulse input is used to check the pulse train integrity from the flow meter to the flow computer. Flow check pulse input channel is selected in pair with flow pulse channel if the flow meter provides dual pulse output.

• flow frequency;

The frequency of the pulse signal is proportional with the flow rate measured by the meter. The flow computer converts the frequency to the flow rate using the low and high range values and the flow rate then totalized.

density frequency;

The frequency is proportional to the density measured with the density transducer. The flow computer converts the frequency to the density according to the equation provided by the manufacturer of the densitometer.

The pulse input data page has different view depending on the signal type. The data pages for each signal type are shown below.

Function of the F keys on the pulse input channel data page

- select the next field for editing

Figure 9-61 Pulse input channel (signal type = density frequency) data page

The editable fields on the data page are as follows:

- Signal name
 - Any character string up to 18 characters, for example: FIQ 501 density
 - Signal type
 - o Density;
 - Unit
 - o kg/m3
 - o lb/CF
 - o RD
 - Pulse transm. (Pulse transmitter type)
 - o active 5 V;
 - o active 15 V;
 - o open collector (12 V);
 - O NAMUR
 - Density transmitter type
 - o linear;
 - Solatron 3096R; (unit changes to (none) for relative density)
 - o Solatron 3096N;
 - o Solatron 7812;
 - o Solatron 7835;
 - Density cnst (constants for the density transducers from the calibration certificate)
 - Solatron 3096R K0, K2;
 - Solatron 3096N K0, K2;
 - o Solatron 7812 K0, K1, K2, K3, K4, K18, K19;
 - Solatron 7835 K , K0, K1, K2, K3, K4, K18, K19, K20A, K20B, K21A, K21B; (K is a generals purpose scale parameter)
 - LO_scale (low scale of the parameter in engineering unit);
 - HI_scale (high scale of the parameter in engineering unit);

- LO_limit (low alarm limit);
- HI_limit (high alarm limit);
- LOLO_limit (low-low alarm limit);
- HIHI_limit (high-high alarm limit);
- Keypad value; see the activation of the Keypad value in section 9.3 Alarm and events
- Event at;

It can be selected here that which of the events shall initiate an entry in the event log file of the flow computer and which of the events shall generate event in the alarm system. The options are:

- o lsc (low scale);
- o hsc (high scale);
- o lo (lo limit);
- o hi (hi limit);
- o lolo (lolo limit);
- o hihi (hihi limit);
- Log
- Eventing

Selecting y(yes) in the "Log" line causes an entry shall be generated in the log file.

Selecting n(no) in the Log line causes no entry is generated in the log file. In this case no y(yes) can be selected in the "Eventing" line.

If in the "Log" line y(yes) is selected, then in the "Eventing" line y(yes) or n(no) can be selected, i.e. the operator can decide if the event generates event in the alarm system or not.

- Live/check signal
 - o live;
 - Hz; (enter check signal is Hz)
 - o usec; (enter check signal is usec)
- Check signal; (displayed only if Live/check signal set to Hz or usec. This feature is provided for test purpose only. Do not forget to set the Live/check signal to "live" after the test to recover the normal operation of the flow computer.)
- Signal status
 - o active;
 - o inactive;

9.2.1.4 Pulse output channel

PITC4641 board has one pulse output channel.

The function of this channel is to transmit the pulses received on Flow pulse input channel.

These pulses transmitted to the Prover computer. This output is used in connection with the proving operation. See description of the proving operation in the Prover computer Instruction manual.

The operation mode of the pulse output channel is selected from the list as follows:

- AUTO
 - The operation of the pulse output controlled by the prover computer. This is the mode shall be selected when flow computer operates together with the prover computer.
- OFF
- No pulse is transmitted via pulse output.
- PI Ch.1 ON
- Pulses received on Channel 1 pulse input channel of the PITC4641 board will be transmitted via pulse output channel.
- PI Ch.2 ON
- Pulses received on Channel 2 pulse input channel of the PITC4641 board will be transmitted via pulse output channel. PI Ch.3 ON
- Pulses received on Channel 3 pulse input channel of the PITC4641 board will be transmitted via pulse output channel. PI Ch.4 ON
- Pulses received on Channel 4 pulse input channel of the PITC4641 board will be transmitted via pulse output channel.

Function of the F keys on the pulse output channel data page

- select the next field for editing
- f select the previous field for editing
- Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

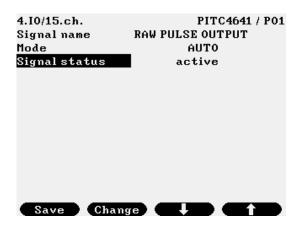

Figure 9-62 Pulse output channel data page

9.2.1.5 Digital input channel

Depending on the selected signal type of the digital (2-state) input the parameters and the data pages are different. The signal types are as follows:

Dual state;

.

- It is used to indicate two status of any equipment (for example valve) represented by an open and closed state of a contact. Pulse:
 - It is used to totalize the flow by counting low frequency (50 Hz maximum) pulse train from flow meter.

The data pages for each signal type show below.

Function of the F keys on the digital input channel data page

- select the next field for editing
- f select the previous field for editing

Change modify the selected data field

- **OK** Confirm the selection
- **Save** save the selected/entered data and returns to the parent menu.
- ⇒ remove the highlighted item from the eventing list and step to the next item

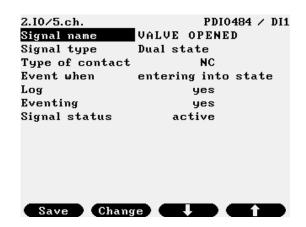

Figure 9-63 Digital input channel (signal type = dual state) data page

The editable fields on the data page are as follows:

- Signal name
 - Any character string up to 18 characters, for example: FV 501 valve status
- Signal type
 - o Dual state;
- Type of contact
 - o NO (normally open);
 - o NC (normally closed);
- Event when
 - o entering into state;
 - o exiting from state;

- o at changing state;
- Log
 - o yes;
 - o no;
- Eventing; (generate event in the event log of the flow computer)
 - o yes;
 - o no;
- Signal status
 - o active;
 - o inactive;

2.10/7.ch. Signal name	PDI0484 ∕ DI3

Filter const.1	0
Filter const.2	0
Signal status	active
Save Chang	

Figure 9-64 Digital input channel (signal type = pulse) data page

The editable fields on the data page are as follows:

- Signal name
 - Any character string up to 18 characters, for example: FIQ 501 pulse
- Signal type
 - o Pulse;
 - Unit
 - o m3;
 - o kg;
 - o GJ;
 - o MWh; o MVAh;
 - o MVAh
 o MCF;
 - O MCF
 - o lb;
 - o MMBTU;
 - o bbl;
 - o Mlb
 - Type of contact
 - NO (normally open);
 - NC (normally closed);
- K-factor mode;
 - o pulse/unit (volume or mass or energy);
 - o unit/pulse;
- K-factor;
- Filter constant 1
- Filter constant 2

Filter constant are to apply digital filtering to the low frequency input signal. The goal of this filtering is to produce smoothly changing flow rate when the frequency of the input signal is lower then the frequency of the calculation cycle (which is 500 ms) in the flow computer.

0 < Filter constant < 1. If Filter constant = 0 then filter is switched off.

Recommended value for the filter constant depending on the time constant of the process is according to the table below:

Time constant (s)	Filter constant
1	0.3935
5	0.0952

10	0.0488
30	0.0165
60	0.0083

The smaller the filter constant the more accurate will be flow rate displayed but time required to achieve the final flow rate will take longer.

- Signal status
 - o active;
 - o inactive;

9.2.1.6 Digital output channel

Depending on the selected signal type of the digital (2-state) output channel the parameters and the data pages are different. The signal types are as follows:

- Pulse;
 - It is used to provide pulse output proportional to any total of any metering stream.
- STR FR alarm (stream flow rate alarm); It is used to provide alarm output for any flow rate of any metering stream.
 STR fault alarm (stream in fault state);
- It is used to provide alarm output for a particular stream it the stream is in fault state.
- Analog input alarm (for any analogue input);
- It is used to provide alarm output for any analogue input signal limit.
- Digital input alarm (for any digital input); It is used to provide alarm output for any digital input.
- Common alarm;
- It is used to provide alarm output in case of general process alarm is active.
- Time base;
 - It is used to provide pulses as time base for any external equipment.
- Batch control; It is used to control the batching process.

The data pages for each signal type show below.

Function of the F keys on the digital output channel data page

- select the next field for editing
- f select the previous field for editing
- Change modify the selected data field
- **OK** Confirm the selection
- Save save the selected/entered data and returns to the parent menu.
- ➡ remove the highlighted item from the eventing list and step to the next item

Figure 9-74 HART input channel data page

The editable fields on the data page are as follows:

•

- HART loop number; (from 1 to 4)
- Transmitter address; (from 0 to 15) If address 0 is selected then only one single transmitter can be connected on one loop. In this case transmitter provides both current output and HART output.
 - If any address from 1 to 15 is selected then the transmitter signal available on HART only.
 - PV index (from 1 to 4) The maximum number of PV indexes in one loop is 15. See details on the HART transmitter connections in Annex C.

- Signal update timeout
 - Selected from the list:
 - o yes
 - o no

If signal update timeout is set to no, then no signal update timeout will be checked. If signal is not updated then the last valid value will be used in the calculation without time limit.

If signal update timeout is set to yes, then the timeout in seconds shall be specified

• Timeout

Within the "timeout" time the last value of the HART signal will go to the calculation (last good value),

After the "timeout" time has expired and the signal still not updated

- in case of non-flow signal (pressure, temperature) the keypad value of the signal goes to the calculation
- in case of flow signal (differential pressure, flow rate) zero goes to the calculation
- Signal name

Any character string up to 18 characters, for example: FIQ 501 pressure

- Signal type
- Unit
- Supplementary parameter (depending on the signal type)

The signal type (type of the physical parameter measured at the channel), its unit of measurement and the supplementary parameter are selected from the list below:

- HI_current (high scale of the current input);
- LO_scale (low scale of the parameter in engineering unit);
- HI_scale (high scale of the parameter in engineering unit);
- LO_limit (low alarm limit);
- HI_limit (high alarm limit);
- LOLO_limit (low-low alarm limit);
- HIHI_limit (high-high alarm limit);
- Keypad value; Keypad value is not available for differential pressure, flow rate and level signals. See the activation of the Keypad value in section 9.3. Alarm and events
- Event at;

It can be selected here that which of the events shall initiate an entry in the event log file of the flow computer and which of the events shall generate event in the alarm system. The options are:

- o lsc (low scale);
- o hsc (high scale);
- o lo (lo limit);
- o hi (hi limit);
- o lolo (lolo limit);
- o hihi (hihi limit);
- Log
- Eventing

Selecting y(yes) in the "Log" line causes an entry shall be generated in the log file.

Selecting n(no) in the Log line causes no entry is generated in the log file. In this case no y(yes) can be selected in the "Eventing" line.

If in the "Log" line y(yes) is selected, then in the "Eventing" line y(yes) or n(no) can be selected, i.e. the operator can decide if the event generates event in the alarm system or not.

- Signal status
 - o active;
 - o inactive;

IMPORTANT

If the signal configured for a channel is to be used in flow calculation, then the unit of measurement shall be selected as follows: In case of metric unit system:

- pressure signal: bar
- differential pressure signal: mbar
- temperature signal: °C
- In case of imperial unit system for gas measurement:
- pressure signal: PSIG or PSIA
- differential pressure signal: inH2O
- temperature signal: °F

9.2.1.9 Modbus signal channel

There are 30 Modbus channels available in UNIFLOW-200. They can be configured as input channels

The Modbus channels can be used and shall be setup in the same way as the corresponding input channels. They can be written via the serial and Ethernet link of the flow computer.

The address range of the general purpose Modbus registers is 4000, 4002, 4004, ..., 4058 (30 registers). Data type to be written into these registers is 4 byte floating point data. See 10.4.3.4 for floating point data representation.

There are some special predefined Modbus registers used in the serial communication with the ultrasonic meters as follows:

- registers with address 2700 holds the volume flow rate at line conditions read from the ultrasonic meter on com 1 port;
- registers with address 2708 holds the volume flow rate at line conditions read from the ultrasonic meter on com 2 port;
- registers with address 2716 holds the volume flow rate at line conditions read from the ultrasonic meter on com 3 port;
- registers with address 2724 holds the volume flow rate at line conditions read from the ultrasonic meter on com 4 port;
- registers with address 2732 holds the volume flow rate at line conditions read from the ultrasonic meter on com 5 port;
- registers with address 2740 holds the volume flow rate at line conditions read from the ultrasonic meter on com 6 port;
- registers with address 2748 holds the volume flow rate at line conditions read from the ultrasonic meter on com 7 port;
- registers with address 2756 holds the volume flow rate at line conditions read from the ultrasonic meter on com 8 port;

The Modbus channels used as input channel for flow measurement with ultrasonic meters shall be setup to one of the above register addresses, depending on the com port the meter connected to.

Function of the F keys on the Modbus channel data page

- select the next field for editing
- f select the previous field for editing
- ⇒ remove the highlighted item from the eventing list and step to the next item
- Change modify the selected data field
- **OK** Confirm the selection
- Save save the selected/entered data and returns to the parent menu.

Figure 9-76 Modbus channel data page

The Modbus specific editable fields on the data page are as follows:

- Register address;
- Register update timeout
- Selected from the list:
 - o yes
 - o no

If register update timeout is set to no, then no register update timeout will be checked. If register is not updated then the last valid value will be used in the calculation without time limit.

If signal update timeout is set to yes, then the timeout in seconds shall be specified

Timeout

Within the "timeout" time the last value of the register will go to the calculation (last good value),

After the "timeout" time has expired and the signal still not updated

- in case of non-flow signal (pressure, temperature) the keypad value of the signal goes to the calculation
- in case of flow signal (differential pressure, flow rate) zero goes to the calculation

All of the other parameters for Modbus channels are identical with those of the corresponding input channels.

IMPORTANT

If the channel status is inactive then the channel cannot be used in the flow calculation even if you set all the parameters of the channel. Do not forget to set the channel active if you want to use the signal measured at the channel in the flow calculation.

9.2.2 Stream setup

After all the field I/O signals required for the particular application are setup and configured the metering streams should be setup. There are different procedure for setting up physical streams (streams measuring real fluid flow) and virtual streams (streams calculated from the flows of physical streams).

The stream setup in case of physical streams is done in four steps in four different submenus of the parameters menu.

First the fluid to be measured is selected and the physical properties of the fluid shall be defined.

In the second step the flow meter is selected and the parameters of the flow meter shall be entered.

In third step the field I/O signals assigned to the measured input parameters required for flow calculation.

In last step the premium limits are setup for the stream.

Setup procedure for the virtual stream includes the definition of the equation for the flow calculation and the setup of the premium limits.

Entering the physical stream menu item data page appears on the display. The serial number of the stream to be edited shall be selected and the identifier of the stream can be entered. The identifier is a 24 character long alphabetical string.

Note

The identifier of the stream will be part of the file name the archive data stored in.

9.2.2.1 Physical stream setup

Route in the menu tree: Parameters Streams Physical stream Physical stream Physical stream Main menu Stream No. 8 Virtual stream I ASZK Parameters Prem. mode setup Str. name metric units Fault mode setup Unit Т Stream Barometric press. Averaging Totals format 1 Save Change

The system of units shall be selected on this page. Available selections are:

```
o metric units;
              imperial units;
           0
Note:
If the "imperial units" is selected then the fluid selection shall be:
"Hydrocarbon mixture / Natural gas, Coke oven gas, Blast furnace gas" Or
"Liquid / Crude oil & products"
No other fluids are supported in imperial units.
In case of "imperial units" the base conditions can be selected as follows:
       For gases:
           o base temperature = 59, 60 ^{\circ}F;
           o base pressure = 14.4, 14.5, 14.65, 14.696, 14.7, 14.73, 15.025 PSIA
       For liquids:
           o base temperature = 60 \, {}^{\circ}F;
           o base pressure = 0 PSIG
```

9.2.2.1.1 Fluid selection After the stream is selected the fluid and its properties shall be defined.

Depending on the fluid selected the fluid specific data page appears.

The figures in this chapter explain the parameters of the different fluid to be defined and the options available for selection.

9.2.2.1.1.1 Fuel gases

There are three predefined fuel gases can be selected:

- 0 Natural gas; 0
 - Coke oven gas;
- o Blast furnace gas.

The data pages for each of them are shown in the paragraphs below.

9.2.2.1.1.1.1 Natural gas

Route in the me	nu tree:

Figure 9-79 Natural gas data page (imperial example)

The data fields on the data page are as follows:

Base temperature;

The base temperature selected from list In metric units:

- o 15 °C;
- o 15.556 °C;
- o 20 °C;
- o 0 °C;

In imperial units:

- o 59 °F;
- o 60 °F;
- Base pressure;

In metric units: Not editable, fixed to 1.01325 bar In imperial units:

- o 14.4 PSIA;
- o 14.5 PSIA;
- o 14.65 PSIA;
- o 14.696 PSIA;
- o 14.7 PSIA;
- o 14.73 PSIA;
- o 15.025 PSIA;
- Combustion reference temperature;

The combustion reference temperature selected from list

- In metric units:
 - o 15 °C;
 - o 15.556 °C;
 - o 20 °C;
 - o 0 °C;
- In imperial units:
 - o 60 °F;

If 15.556 °C base temperature is selected, then the combustion reference temperature automatically set to 15.556 °C.

- Chromatograph polling;
 - o no (no chromatograph polling is performed);
 - o yes (chromatograph is polled for gas composition).
 - NOTE: One of the serial port shall be connected to the gas chromatograph and the port function shall be set according to the type of the gas chromatograph to be polled. See 9.2.4.1.
- Gas composition;

It shall be defined if the properties of the natural gas (density, compression factor, etc.) will be calculated from the detailed gas composition or from the limited set of gas composition. The options are:

- o detailed (gas composition);
 - 21 components are assumed as defined in the AGA8-92 standard
- limited (gas composition);

3 components (N2, CO2, H2) are assumed as defined in the GERG 88 standard and relative/base density and superior calorific value to be entered.

If detailed composition is selected new menu page appears allowing select data pages for entering detailed gas composition.

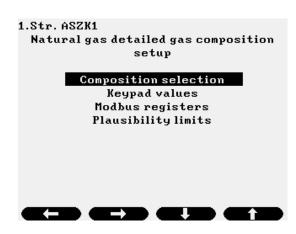

Figure 9-80 Natural gas detailed gas composition menu page

Selecting the menu items one by one data pages appear as follows.

01.Str. NGAS-ORIFICE Natural gas detailed Components selection Selected from	gas composition identical Modb. Daniel

The data fields on the data page are as follows:

- Components selection;
 - Reserved for future use
 - o identical;
- Selected from;

The detailed gas composition used in the calculation can be selected from:

- o Keypad value;
 - The fixed values of the concentrations entered by the operator are used.
- o Modb. Daniel;

The gas composition is downloaded into the UNIFLOW-200 on Modbus link (serial or Ethernet) from supervisory system in Daniel/Enron/Omni format. The register formats and map see in the section 10 Communications.

- Modb. STD1;
 The gas composition is downloaded into the UNIFLOW-200 on Modbus link (serial or Ethernet) from supervisory system. The register formats and map, is shown in the section 10 Communications.
- o Modb. STD2;

The gas composition is downloaded into the UNIFLOW-200 on Modbus link (serial or Ethernet) from supervisory system. The register formats and map, is shown in the section 10 Communications.

o User Modbus;

The gas composition is downloaded into the UNIFLOW-200 on Modbus link (serial or Ethernet) from supervisory system. The register formats and map are according to User Modbus table.

02	oxygen
CO	carbon-monoxide
H2	hydrogen

Ar

argon

Beside the 21 components from AGA8 additional components from AGA5 and GPA 2172 can be entered as follows Ammonia ammonia Benzene benzene 22-Dimethyl Propan dimet-propan-22 met-pent-2 2-Methyl Pentane 3-Methyl Pentane met-pent-3 dimet-but-22 22-Dimethyl Butane dimet-but-23 23-Dimethyl Butane ethylene Ethylen Propylene propylen Methyl Alcohol meth-alcohol Sulfur Dioxide sulf-dioxid air Air

The sum of the entered mole percentage must be in the 95 % - 105 % range. If the sum is outside this range, then the composition is rejected.

If the sum is inside the 95 % - 105 % range then UNIFLOW-200 performs normalization on the concentration and the normalized concentration is stored as keypad values.

The sum of the mole concentrations is checked on the downloaded composition also and the normalization is done if necessary.

Figure 9-83 Natural gas Modbus registers data page

The Modbus registers for the 21 components and for the relative density, inferior calorific value and superior calorific value are displayed here.

The page is read only.

If limited composition is selected data page appears allowing enter the concentration of the nitrogen, carbon-dioxide and hydrogen.

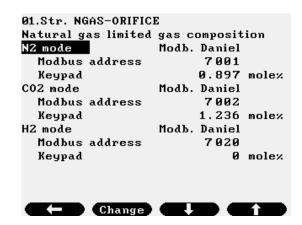

Figure 9-84 Natural gas limited gas composition data page

The data fields on the data page are as follows:

- N2 mode;
 - Select the source of the nitrogen concentration from the list:
 - o Keypad value;
 - The fixed value of the concentration entered by the operator is used. Selecting "keypad" data entry field appears to enter the keypad value.
 - N2mol% o measured;

Signal representing the concentration is measured on input channel (analog or Modbus or Hart). One channel in I/O signal setup section should be configured as "Special" signal type with mole % unit.

- Modb. Daniel;
 Concentration is received as data on Modbus link in Daniel/Enron/Omni format.
 Selecting "Modb. Daniel" data entry fields appear to enter the Modbus register
 N2 mole% modbus register; (register address where the concentration is downloaded)
- Modb. STD1;
 Concentration is received as data on Modbus link in Modb. STD1 format.
 Selecting "Modb. STD1" data entry fields appear to enter the Modbus register
 N2 mole% modbus register; (register address where the concentration is downloaded)
- o Modb. STD2;

Concentration is received as data on Modbus link in Modb. STD2 format.

Selecting "Modb. STD2" data entry fields appear to enter the Modbus register

- N2 mole% modbus register; (register address where the concentration is downloaded)
- CO2 mode;
- H2 mode;
 - Data fields for CO2 mode and H2 mode identical with those for N2 mode.
- Comp. downl. timeout (Gas composition download timeout);
- If the gas composition selection set to Modb. Daniel, Modb. STD1 or Modb.STD2 and no new gas composition is received within the timeout specified here then alarm is raised and the keypad gas composition will be used in the calculation. The timeout entry is limited to 60 000 minutes (approx.. 42 days).

	Change		

Figure 9-85 Natural gas plausibility limits data page

The data fields on the data page are as follows:

• Plausibility limit check;

o yes

o no;

If "yes" is selected, the gas composition received from any sources (read from gas chromatograph, downloaded via Modbus link, entered as fixed value) will be checked against the upper plausibility limits listed on the data page.

If any of the components is outside the limit the whole set of gas composition will be rejected (not only the component outside the limit) and the previous valid gas composition will be used in the calculation.

If "no" is selected, no such plausibility limit check will be performed.

The operator cannot change the numerical values of the plausibility limits.

Caution!

Turning off the plausibility check and entering gas composition outside the plausibility limits, above certain pressure and below certain temperature may lead to instability in calculation (especially in compression factor and line density calculations) or these calculations may fail.

Turn it off with special care only.

Compression factor mode;

The mode for the compression factor determination is selected here from the list as follows:

o AGA8-92DC

Compression factor is calculated according to the AGA8-92DC equation from the detailed gas composition.

AGA8-92Gr1

Compression factor is calculated according to the AGA8-92 Gross method 1 from the superior calorific value, relative density and CO2 content.

The H2 and CO are taken into the calculation as described in SGERG TM5 1991.

If AGA8-92Gr1 is selected entry field opens to enter the combustion reference temperature. It is selected from the list 0, 15, 20, 25 °C.

o AGA8-92Gr2

Compression factor is calculated according to the AGA8-92 Gross method 2 from the relative density, CO2 and N2 content.

The H2 and CO are taken into the calculation as described in SGERG TM5 1991.

o SGERG88

Compression factor is calculated according to the SGERG 88 according to ISO 12213-3 from the base density, superior calorific value, CO2 and H2 content.

- GERG91mod (available in metric units only)
 Compression factor is calculated according to the GOST 30319.2-96 from the base density, CO2 and N2 content. In case of GERG91mod selection the base temperature is automatically set to 20 °C
- NX19mod (available in metric units only)
 Compression factor is calculated according to the GOST 30319.2-96 from the base density, CO2 and N2 content. In case of NX19mod selection the base temperature is automatically set to 20 °C
- o VNIC SMV (available in metric units only)
- Compression factor is calculated according to the GOST 30319-2-96 from the detailed gas composition. • AGA NX19
- Compression factor is calculated according to the AGA NX19 from the relative density, CO2 and N2 content.
 z keypad The operator entered keypad value is used in the flow calculation.
- If Z keypad is selected then two entry fields open to enter the base compression factor and line compression factor keypad values.
- AGA8 / 85
 Compression factor is calculated according to the AGA8 1985 edition from the detailed gas composition.
- o GOST 30319.2-2015

Compression factor is calculated according to the GOST 30319-2.2015 standard from the base density, CO2 and N2 content.

o GOST 30319.3-2015

Compression factor is calculated according to the GOST 30319-3.2015 standard from the detailed gas composition.

- AGA8 Part2-2017
 Compression factor is calculated according to the AGA Report No.8 Part 2 April 2017 (GERG-2008 Equation of State) from the detailed gas composition.
- AGA8 P1-2017 DC
 Compression factor is calculated according to the AGA Report No.8 Part 1 April 2017 (DETAIL Equation of State) from the detailed gas composition.
- AGA8 P1-2017 Gr-M0
 Compression factor is calculated according to the AGA Report No.8 Part 1 April 2017 (GROSS Equation of State, Method 0) from the detailed gas composition.

o AGA8 P1-2017 Gr-M1

Compression factor is calculated according to the AGA Report No.8 Part 1 April 2017 (GROSS Equation of State, Method 1) from the relative density, gross calorific value and CO2 content.

- AGA8 P1-2017 Gr-M2
 Compression factor is calculated according to the AGA Report No.8 Part 1 April 2017 (GROSS Equation of State, Method 2) from the relative density, CO2 and N2 content.
- AGA8 P1-2017 Gr-M3
 Compression factor is calculated according to the AGA Report No.8 Part 1 April 2017 (GROSS Equation of State, Method 3) from the detailed gas composition.
- Line density mode;

0

The mode for the line density determination is selected here from the list as follows:

o PTZ

- Line density calculated from the base density with pressure, temperature and compression factor correction. AGA7
- Line density calculated from the base density with pressure, temperature and compression factor correction as defined in AGA7.
- o AGA8/92DC
 - Line density is taken from the AGA8/92DC calculation.
- o keypad The operator entered keypad value is used in the flow calculation.
- If keypad is selected entry field opens to enter the keypad value. GOST 30319.2-2015
- Line density is calculated according to the GOST 30319-2.2015 standard.
- o GOST 30319.3-2015

Line density is calculated according to the GOST 30319-3.2015 standard.

o AGA8 Part2-2017

Line density is calculated according to the AGA Report No.8 Part 2 April 2017 (GERG-2008 Equation of State) from the detailed gas composition.

o AGA8 P1-2017 DC

Line density is calculated according to the AGA Report No.8 Part 1 April 2017 (DETAIL Equation of State) from the detailed gas composition.

o measured

Signal representing the line density is measured on input channel. One channel in I/O signal setup section should be configured as "Line density" signal type.

o Modb. Daniel

Line density is received as data on Modbus link in Daniel/Enron/Omni format.

If Modb. Daniel is selected entry field opens to enter the keypad value.

This keypad value will be used in calculation if no data received within the timeout time.

o Modb. STD2

Line density is received as data on Modbus link in Modb. STD2 data format.

If Modb. STD2 is selected entry field opens to enter the keypad value.

This keypad value will be used in calculation if no data received within the timeout time.

Base density mode;

The mode for the base density determination is selected here from the list as follows:

o measured

Signal representing the base density is measured on input channel. One channel in I/O signal setup section should be configured as "Base density" signal type.

- o Calc. from rel. (calculated from relative density)
- Base density is calculated from Relative density
- o Modb. Daniel

Base density is received as data on Modbus link in Daniel/Enron/Omni format.

If Modb. Daniel is selected entry field opens to enter the keypad value.

This keypad value will be used in calculation if no data received within the timeout time.

o keypad

The operator entered keypad value is used in the flow calculation.

If \mathtt{keypad} is selected entry field opens to enter the keypad value.

o ISO6976:1995

Base density is calculated from the detailed gas composition according to ISO 6976:1995 standard. o ISO6976:2016

Base density is calculated from the detailed gas composition according to ISO 6976:2016 standard. o Modb. STD2

Base density is received as data on Modbus link in Modb. STD2 format.

If Modb. STD2 is selected entry field opens to enter the keypad value. This keypad value will be used in calculation if no data received within the timeout time.

- GOST 30319.1-96 (available in metric units only)
 Base density is calculated from the detailed gas composition according to GOST 30319.1-96 standard. In case of GOST 30319.1-96 selection the base temperature is automatically set to 20 °C.
- GPA 2172-09 (available in imperial units only)
 Base density is calculated from the detailed gas composition according to GPA 2172-09.

• Relative density mode;

The mode for the relative density determination is selected here from the list as follows:

- o ISO6976:1995
- Relative density is calculated from the detailed gas composition according to ISO6976:1995 standard. o ISO6976:2016
- Relative density is calculated from the detailed gas composition according to ISO6976:2016 standard. o AGA5
 - Relative density is calculated from the detailed gas composition according to AGA5.
- o GPA 2172-09 (available in imperial units only)
- Relative density is calculated from the detailed gas composition according to GPA 2172-09. o measured
- Signal representing the relative density is measured on input channel. One channel in I/O signal setup section should be configured as "Relative density" signal type.
- Calc. from base (Calculated from Base density) Relative density is calculated from Base density
- o Modb. Daniel

Relative density is received as data on Modbus link in Daniel/Enron/Omni format. If Modb. Daniel is selected entry field opens to enter the keypad value. This keypad value will be used in calculation if no data received within the timeout time.

o Modb. STD1

Relative density is received as data on Modbus link in Modb. STD1 format. If Modb. STD1 is selected entry field opens to enter the keypad value. This keypad value will be used in calculation if no data received within the timeout time.

- o Modb. STD2
 - Relative density is received as data on Modbus link in Modb. STD2 format.

If Modb. STD2 is selected entry field opens to enter the keypad value.

This keypad value will be used in calculation if no data received within the timeout time.

o keypad

The operator entered keypad value is used in the flow calculation.

If keypad is selected entry field opens to enter the keypad value.

• Inferior calorific value mode;

The mode for the inferior calorific value determination is selected here from the list as follows:

- o ISO6976:1995
 - Inferior calorific value is calculated from the detailed gas composition according to ISO6976:1995 standard. 0 ISO6976:2016
 - Inferior calorific value is calculated from the detailed gas composition according to ISO6976:2016 standard.
 - o GOST 30319.1-96 (available in metric units only)
 - Inferior calorific value is calculated from the detailed gas composition according to GOST 30319.1-96 standard. • AGA5
 - Inferior calorific value is calculated from the detailed gas composition according to AGA5.
 - o GPA 2172-09 (available in imperial units only)
 - Inferior calorific value is calculated from the detailed gas composition according to GPA 2172-09.
 - o measured

Signal representing the inferior calorific value is measured on input channel. One channel in I/O signal setup section should be configured as "Inferior calorific value" signal type.

- Modb. Daniel
 Inferior calorific value is received as data on Modbus link in Daniel/Enron/Omni format.
 If Modb. Daniel is selected entry field opens to enter the keypad value.
 This keypad value will be used in calculation if no data received within the timeout time.
- Modb. STD1
 Inferior calorific value is received as data on Modbus link in Modb. STD1 format.
 If Modb. STD1 is selected entry field opens to enter the keypad value.
 This keypad value will be used in calculation if no data received within the timeout time.
- Modb. STD2
 Inferior calorific value is received as data on Modbus link in Modb. STD2 format.
 If Modb. STD2 is selected entry field opens to enter the keypad value.

This keypad value will be used in calculation if no data received within the timeout time.

o keypad

The operator entered keypad value is used in the flow calculation

Superior calorific value mode;

The mode for the superior calorific value determination is selected here from the list as follows:

- o ISO6976:1995
- Superior calorific value is calculated from the detailed gas composition according to ISO6976:1995 standard. o ISO6976:2016
- Superior calorific value is calculated from the detailed gas composition according to ISO6976:2016 standard. O GOST 30319.1-96 (available in metric units only)
- Superior calorific value is calculated from the detailed gas composition according to GOST 30319-1. • AGA5
- Inferior calorific value is calculated from the detailed gas composition according to AGA5.
- o GPA 2172-09 (available in imperial units only)
- Superior calorific value is calculated from the detailed gas composition according to GPA 2172-09.
- o measured

Signal representing the superior calorific value is measured on input channel.

- One channel in I/O signal setup section should be configured as "Superior calorific value" signal type. o Modb. Daniel
- Superior calorific value is received as data on Modbus link in Daniel/Enron/Omni format. If Modb. Daniel is selected entry field opens to enter the keypad value.

This keypad value will be used in calculation if no data received within the timeout time.

o Modb. STD2

Superior calorific value is received as data on Modbus link in Modb. STD2 format.

If Modb. STD2 is selected entry field opens to enter the keypad value.

This keypad value will be used in calculation if no data received within the timeout time.

o keypad

The operator entered keypad value is used in the flow calculation

• Dynamic viscosity mode;

The mode for the dynamic viscosity determination is selected here from the list as follows:

o GOST 30319.1-96

Dynamic viscosity calculated from the base density, N2 and CO2 content, pressure and temperature according to GOST 30319.1-96

- GOST 30319.2-2015
 Dynamic viscosity calculated from the base density, N2 and CO2 content, pressure and temperature according to GOST 30319.2-2015
- GOST 30319.3-2015
 Dynamic viscosity calculated from the detailed gas composition, pressure and temperature according to GOST 30319.3-2015
- o keypad The operator entered keypad value is used in the flow calculation.
- Isentropic exponent mode;

The mode for the isentropic exponent determination is selected here from the list as follows:

- GOST 30319.1-96
 Isentropic exponent is calculated from the base density, CO2 content, pressure and temperature according to GOST 30319.1-96
- o ISO 20765-1
 - Isentropic exponent is calculated according to ISO 20765-1 from the detailed gas composition.
- o GOST 30319.2-2015

Isentropic exponent is calculated from the base density, CO2 content, pressure and temperature according to GOST 30319.2-2015

- GOST 30319.3-2015
 Isentropic exponent is calculated from the detailed gas composition, pressure and temperature according to GOST 30319.3-2015
- AGA8 Part2-2017 Isentropic exponent is calculated according to the AGA Report No.8 Part 2 April 2017 (GERG-2008 Equation of State) from the detailed gas composition.
- AGA8 P1-2017 DC
 Isentropic exponent is calculated according to the AGA Report No.8 Part 1 April 2017 (DETAIL Equation of State) from the detailed gas composition.
- o keypad

The operator entered keypad value is used in the flow calculation

- Joule-Thomson coefficient mode;
 - The mode for the Joule-Thomson coefficient determination is selected here from the list as follows:
 - o ISO TR 9464
 - Joule-Thomson coefficient is calculated from the pressure and temperature according to ISO TR 9464 o ISO 20765-1
 - Joule-Thomson coefficient is calculated according to ISO 20765-1 from the detailed gas composition.
 - AGA8 Part 2-2017
 Joule-Thomson coefficient is calculated according to the AGA Report No.8 Part 2 April 2017 (GERG-2008 Equation
 - of State) from the detailed gas composition.
 o AGA8 P1-2017 DC
 Joule-Thomson coefficient is calculated according to the AGA Report No.8 Part 1 April 2017 (DETAIL Equation of State) from the detailed gas composition.
 - keypad
 The operator entered keypad value is used in the flow calculation
- Velocity of sound mode;

The mode for the velocity of sound determination is selected here from the list as follows:

- o ISO 20765-1
 - Velocity of sound is calculated from the detailed gas composition according to ISO 20765-1
- GOST 30319.1-96
 Velocity of sound is calculated according to GOST 30319.1-96.
- GOST 30319.2-2015
 Velocity of sound is calculated according to GOST 30319.2-2015.
- o GOST 30319.3-2015 Velocity of sound is calculate
- Velocity of sound is calculated according to GOST 30319.3-2015.
- AGA8 Part2-2017
 Velocity of sound is calculated according to the AGA Report No.8 Part 2 April 2017 (GERG-2008 Equation of State) from the detailed gas composition.
- AGA8 P1-2017 DC
 Velocity of sound is calculated according to the AGA Report No.8 Part 1 April 2017 (DETAIL Equation of State) from the detailed gas composition.
- o keypad The operator entered keypad value is used.
- Water content mode (available in imperial units only);

If any of the Relative density mode, Base density mode, Inferior calorific value mode or Superior calorific value mode is selected as GPA 2172-2009, then the water content mode shall be selected from the list as follows:

- o dry
 - Water content is assumed to be 0.
- o saturated @ Ps,Ts

It is assumed that the natural gas is saturated with water at saturation pressure Ps and saturation temperature Ts. The concentration of the water is calculated according to GPA 2172-2009. Entry fields for saturation pressure and temperature are opened here.

- Saturation pressure;
- Saturation temperature;
- o saturated @ Pn, Tn

It is assumed that the natural gas is saturated with water at base pressure Pn and base temperature Tn. The concentration of the water is calculated according to GPA 2172-2009.

o measured

Signal representing the water content value in lbmmscf is measured on input channel.

One channel in I/O signal setup section should be configured as "Special" signal type. The unit of measurement for that special signal shall be lbmmscf.

o keypad

0

The operator entered keypad value is used in the flow calculation. Entry field opens here for keypad value of the water content.

- keypad value
- Modbus signal

Signal representing the water content value in lbmmscf is measured on Modbus input channel. One Modbus channel in I/O signal setup section should be configured as "Special" signal type. The unit of measurement for that special signal shall be lbmmscf.

GPM mode (available in imperial units only);

If any of the Relative density mode, Base density mode, Inferior calorific value mode or Superior calorific value mode is selected as GPA 2172-2009, then the GMP mode shall be selected from the list as follows:

o GPA 2172-2009

- The GPM (liquid equivalent) of the natural gas is calculated according to GPA 2172-2009.
- Eventing gas composition limits;

It is operator selectable if the gas composition limits given in Tables 9-2 and Table 9-3 will generate limit alarms and entries in the event log or not.

o yes

o no

Energy calculation from;

It is operator selectable if the energy flow rate of the natural gas stream shall be calculated from inferior or superior calorific value.

o superior calorific value;

o inferior calorific value;

NOTE

The available modes of the natural gas properties listed above depends on that if the detailed or limited set of gas composition is given. There is also an interlock in the base and relative density selections.

The Table 9.1. bellow summarizes the possible modes of the properties.

Table 9.2. and Table 9.3. give the nominal and expanded ranges of gas mixture characteristics for compression factor calculation from detailed and limited set of gas composition.

If the gas mixture characteristics are outside the nominal range but inside the expanded range UNIFLOW-200 generates alarm (if eventing is enabled) but continue the calculation.

Outside the expanded range UNIFLOW-200 generates alarm in any case and tries to continue the compression factor calculation. If due to extreme gas composition the compression factor calculation fails alarm is generated and the last valid calculated compression factor will be used in the flow calculation.

In case of limited gas composition the properties entered must belong to real natural gas. Entering arbitrary calorific value, relative density, CO2 and N2 content may lead to calculation failure (convergence error) in the AGA8-92Gr1 and Gr2 calculation.

Figure 9-86 Coke oven gas composition data page

- Water content mode (available for Coke oven gas and Blast furnace gas only in metric units); Selected from the list as follows:
 - o from gas composition

Water content is equal to the water content entered on the gas composition data page. No additional calculation is done.

o keypad

Water content in mg/m3 shall be entered in the next line below. The water content entered will be converted to mole% and will be taken into account in the gas composition after normalization.

o calculated from P,T

The water content is calculated from the pressure and temperature of the gas, according to the Bukacek equation (IGT Research Bulletin #8).

The calculated water content will be converted to mole% and will be taken into account in the gas composition after normalization.

Route ir	the	menu	tree:	

Parameters	Streams	Physical stream	Stream n.	
		Fluid	HC gas mixture	Blast furn, gas

The blast furnace gas data pages are identical with natural gas data pages except the gas composition and the water content. The name of the blast furnace gas components and their default concentration are listed in the table below.

Components	Abbreviation	Component in AGA8 calculation	mole % (default)
Nitrogen	N2	Nitrogen	57
Carbon-dioxide	CO2	Carbon-dioxide	18
Water	H2O	Water	1
Carbon-monoxide	CO	Carbon-monoxide	21
Hydrogen	H2	Hydrogen	3

 - o from gas composition
 - Water content is equal to the water content entered on the gas composition data page. No additional calculation is done.
 - o keypad

Water content in mg/m3 shall be entered in the next line below. The water content entered will be converted to mole% and will be taken into account in the gas composition after normalization.

o calculated from P,T

The water content is calculated from the pressure and temperature of the gas, according to the Bukacek equation (IGT Research Bulletin #8).

The calculated water content will be converted to mole% and will be taken into account in the gas composition after normalization.

9.2.2.1.1.2 Pure gases

Predefined pure gases are as follows

- o Air;
- o Nitrogen;
- o Oxygen;
- o Argon;
- o Carbon-dioxide;
- o Hydrogen;
- o Carbon-monoxide;
- o Ethylene;
- o Ammonia;
- o Propane;
- o General gas;

The compression factor, dynamic viscosity and isentropic exponent for these gases are calculated according to HE-64 (calculation procedure of Hungarian Office of Measures). The calculation methods described in HE-64 based on the text books, articles as listed in the bibliography of the HE-64.

The data page for pure gases, except "General gas" is shown on the figure below.

Function of the F keys on the Pure gases data page

- select the next field for editing
- select the previous field for editing
- Change modify the selected data field

Save save the selected/entered data and returns to the parent menu.

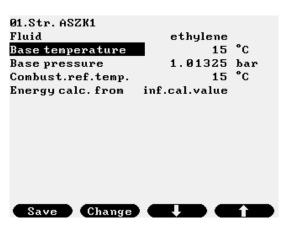

Figure 9-88 Predefined pure gas data page

If the measured gas is not listed in the predefined pure gas list then "General gas" shall be selected. In this case the different properties of the gas shall be entered as keypad values or as measured values as appropriate. In latter case the IO channel the measured properties is assigned to shall be defined in the Stream setup menu.

The data page for "General gas" is shown on the figure below.

9.2.2.1.1.3 Water steam

Route in the menu tree:						
Parameters	Streams	Physical stream	Stream 1.			
		Fluid	Water steam			

The water steam properties are calculated according to Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam (IAPWS-IF97).

The water steam data page is shown on the figure below.

Function of the F keys on the Water steam data page

- select the next field for editing
- select the previous field for editing
- Change modify the selected data field

Save save the selected/entered data and returns to the parent menu.

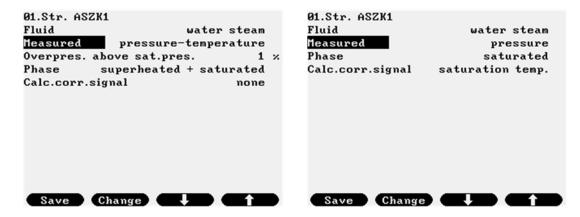

Figure 9-90 Water steam data page for superheated and saturated steam

The data fields on the data page are as follows:

- Fluid;
- Not editable, fixed to water steam.
- Measured;

The measured parameters are selected from the list:

o pressure-temperature

it is assumed that water steam phase is superheated and both temperature and pressure input is required to calculate the properties of the steam.

- Numeric input
- overpressure above saturation pressure, in %

is required in this case. In fact this parameter takes into consideration the uncertainty in pressure measurement.

The flow computer calculates the saturation pressure for the measured temperature. If the measured pressure is above the saturation pressure plus the overpressure parameter then UNIFLOW-200 raises alarm. While the pressure is below this limit UNIFLOW-200 continues the calculation with the measured pressure.

o pressure

it is assumed that water steam phase is saturated. The temperature of the steam is calculated from the saturation line and the properties are calculated from the measured pressure and from the saturation temperature.

o temperature

it is assumed that water steam phase is saturated. The pressure of the steam is calculated from the saturation line and the properties are calculated from the measured temperature and from the saturation pressure.

Table 9-8 CTL and CPL modes, base temperature and base pressure options for liquid hydrocarbons

Density mode;

The density mode selected from the list:

- o meas. at fl. meter (measured at flow meter)
 - If density is measured at flow meter then:
 - the measured density at flow meter will be converted to base density with the meter pressure and meter temperature;
- not measured;
 If density is not measured then keypad value for density at base conditions shall be entered. The Base density mode set to keypad automatically.
- o meas. at header (measured at header pipe);
 - If density is measured at header pipe then:
 - the measured header density will be converted to base density with the header pressure and header temperature;
 - the base density will be converted to density at meter with the meter pressure and meter temperature;
- Base density mode;
 - The density mode selected from the list:
 - o calculated;
 - The base density is calculated from the measured (at header or at meter) density. In case of line density transmitter failure the keypad value of the line density is used in the base density calculations.
 - o Calculated/external;
 - The base density is calculated from the measured (at header or at meter) density. In case of line density transmitter failure the base density is assumed to be constant. The value of the base density is selected from the Product definition table, defined in the Stream setup menu. The product definition table consists of maximum 16 products with the corresponding keypad base densities. The product the base density of which to be used in the calculation is defined via communication interface.
 - This option is used when Batching is enabled and the Batch type is "Pipeline product interface".

Set to calculated if the density mode is measured at flow meter or at the header pipe.

Set to external if the density mode is not measured.

If set to external, source of the base density (measured, Modbus, keypad) is defined in the stream setup menu.

- Density at flow meter mode;
- Not editable.

Set to calculated if the density mode is measured at header pipe or not measured.

- Set to measured if the density mode is measured at flow meter.
- Energy calculation mode;

- o no;
- o yes;

If energy calculation is required then new entry fields appear allowing enter the calorific value mode and the keypad calorific value if not measured. Enabling energy calculation enables the CO2 emission calculation as well. The CO2 emission calculation requires the CO2 emission factor to be entered.

If the fluid type is Products then the subtype of the fuel for CO2 emission shall be selected.

If the fluid type is Crude oil then no subtype selection is required.

The default calorific value and CO2 emission factor for the different fuels are shown in the Table 9.4. below. Both the calorific value and CO2 emission factor can be modified to suit local requirements.

- Fuel subtype (if the fluid = Products only);
 - o heating oil;
 - o fuel oil;
 - o low sulfur heating oil;
 - o heavy heating oil;
 - o gasoline;
 - o diesel oil;
 - Calorific value mode;
 - o keypad;
 - keypad calorific value;
 - o measured;

Signal representing the calorific value is measured on input channel. One channel in I/O signal setup section should be configured as "Calorific value" signal type.

- CO2 emission factor;
 - Keypad value for CO2 emission factor;
- Viscosity type;
 - o kinematic;
 - o dynamic;

Selection of the desired viscosity type

- Viscosity mode;
 - o keypad;

The operator entered keypad value is used in the flow calculation.

o Modbus signal;

Signal representing the kinematic viscosity value is measured on Modbus input channel. One Modbus channel in I/O signal setup section should be configured as "Kinematic viscosity" or "Dynamic viscosity" signal type. measured; (available for kinematic viscosity only)

- measured; (available for kinematic viscosity only)
 Signal representing the kinematic viscosity value is measured on input channel. One analog channel in I/O signal setup section should be configured as "Kinematic viscosity" signal type.
- Keypad value;

Keypad value of the viscosity, dynamic or kinematic;

Fuel type	Calorific value, MJ/kg	CO2 emission factor, tCO2/TJ
Crude oil	40.36	73.3
Heating oil	42.0	74.07
Fuel oil	41.0	77.37
Low sulfur heating oil	40.0	77.37
Heavy heating oil	39.5	77.37
Gasoline	44.0	69.3
Diesel oil	42.0	74.07

Table 9-9 Default values of the calorific value and CO2 emission factors

Temperature and pressure correction of the measured density to the base density and the base density to the density at meter is done according to the method selected in CTL mode and CPL mode menu. See Table 9-8.

NOTE

If the fluid type is Product the subtype of the product (gasoline, intermediate, jet fuel, fuel oil) determined automatically based on the density at base conditions. The limits of the base densities for the product subtypes applied as defined in the standards selected in CTL mode selection menu.

NOTE

The product subtype classified on the base density different from the fuel subtype described in the CO2 emission section.

Figure 9-95 Liquid mixture data page

The liquid mixture fluid option is intended for application where flow of mixture of two different liquids is measured. The density of the mixture is measured as well. Beside the measurement of flow of the mixture the two separate flows for the components the mixture consists of shall be determined. Example of such application is measurement of the mixture of crude oil and gasoline pumped into pipeline.

The data fields on the data page are as follows:

- Fluid;
 - Not editable, fixed to Liquid mixture

• Base temperature;

The base temperature selected from list

- o 20 °C;
- o 15 °C;
- o 0 °C;
- Base pressure;
 - Not editable, fixed to 1 bar.
- Flow measured for;
 - Selected from the list:
 - o fluid 1;
 - o fluid 2;
 - o mixture;

One metering stream of UNIFLOW-200 measures (calculates) and totalizes flow for one single fluid. To have flows and totals for the two liquid components and for the mixture three streams shall be defined with identical parameters except this parameter. In each stream its own fluid to be selected in this data entry.

- Fluid 1 type;
 - Selected from the list:
 - o crude oil;
 - o product;
 - O NGL & LPG
 - o general liquid;
- Fluid 2 type;
 - Selected from the list:
 - o crude oil;
 - o product;
 - O NGL & LPG
 - o general liquid;
 - Fluid 1 base density;
 - Selected from the list:
 - o keypad;
 - keypad base density value;
 - o Modb. sign.;

Modbus I/O signal must be defined for the base density of fluid 1. At the stream setup page, the Modbus signal channel representing the base density shall be assigned to the base density.

- Fluid 1 thermal expansion factor;
 - Keypad value shall be entered.

It is appears only if Fluid 1 type is General liquid.

In case of crude oil and products thermal expansion factor is calculated according to 53A/54A and 53B/54B respectively.

In case of LPG & LNG thermal expansion factor is calculated according to Table 53E/54E (metric units) or Table 23E/24E (imperial units).

Fluid 2 base density;

Selected from the list:

- o keypad;
 - keypad base density value;
- o Modb. sign.;

Modbus I/O signal must be defined for the base density of fluid 2. At the stream setup page, the Modbus signal channel representing the base density shall be assigned to the base density.

Fluid 1 base density and Fluid 2 base density must not be equal.

- Fluid 2 thermal expansion factor;
 - Keypad value shall be entered. It is appearing only if Fluid 2 type is General liquid.

In case of crude oil and products thermal expansion factor is calculated according to 53A/54A and 53B/54B respectively.

In case of LPG & LNG thermal expansion factor is calculated according to Table 53E/54E (metric units) or Table 23E/24E (imperial units).

- Volume contraction factor; Keypad value shall be entered. It takes into account the volume change in case of mixing two different fluids. Default value is 1.0 (no change in the volume), allowable range from 0.95 to 1.05
- Pressure volume correction mode; It pressure volume correction is enabled then compression factor shall be entered.
 no;

o yes;

- Fluid 1 compression factor; Keypad value shall be entered. It is appears only if Fluid 1 type is General liquid. In case of crude oil and products compression factor is calculated according to MPMS Chapter 11.1. In case of LPG & LNG compression factor is calculated according to Chapter 12.2.2M (metric units) or Chapter 12.2.2 (imperial units).
- Fluid 2 compression factor; Keypad value shall be entered. It is appears only if Fluid 2 type is General liquid. In case of crude oil and products compression factor is calculated according to MPMS Chapter 11.1. In case of LPG & LNG compression factor is calculated according to Chapter 11.2.2M (metric units) or Chapter 12.2. (imperial units).
- Mixture dynamic viscosity; Keypad value shall be entered.

9.2.2.1.1.5.5 Electric power

Route in the m	enu tree:			
Parameters	Streams	Physical stream	Stream 1.	
		Eluid	Liquid	Electric power

The "Electric power" fluid selection is intended for electrical power measurement. In this case no flow calculation is required. Input signal from electric power meter is received and only totalization is performed, the electric power is totalized. The unit for the input channel representing the flow rate (in case of the electrical power measurement) shall be selected as MW or MVA in this case.

The flow meter shall be selected as "Electric power meter".

No data page will appear in this case. Message ""Fluid electric power selected" and "Electric power meter selected" will appear on the screen for fluid and flow meter selection respectively.

9.2.2.1.2 Flow meter selection

After the fluid is selected and the parameters are setup the flow meter shall be defined.

Depending on the flow meter selected the flow meter specific data page appears.

The figures in this chapter explain the parameters of the different flow meters to be defined and the options available for selection.

Function of the F keys on the Flow meter selection data pages

- select the next field for editing
- select the previous field for editing
- ⇒ enter into submenu for error curve editing

Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

Figure 9-96 Orifice plate meter data page

The data fields on the data page are as follows:

- dP tappings (Differential pressure tappings);
 - Selected from the list:
 - o flange;
 - o corner;
 - o D and D/2;
- Flow standard;
 - Selected from the list:
 - o ISO 5167:1991;
 - o ISO 5167:1998;
 - o ISO 5167:2003;
 - o GOST 8.563:1997;
 - o GOST 8.586:2005;
 - o AGA 3:1990
 - o AGA 3:2012
- Pipe diameter at 20 oC;
- Keypad value shall be entered.
- Orifice bore diameter at 20 oC; Keypad value shall be entered.

In case of flow standards ISO 5167 (any edition) and AGA 3 (any edition) the thermal expansion coefficients are entered as follows

- Pipe thermal expansion coefficient; Keypad value shall be entered.
- Orifice thermal expansion coefficient; Keypad value shall be entered.

In case of flow standards GOST 8.563-1997 or GOST 8.586-2005 the thermal expansion coefficients are entered as follows

- Pipe th. exp. mode (Pipe thermal expansion factor mode)
 - o calculated;

Selection list is opened and the material of the pipe can be selected from the list. See Table 9-10. Thermal expansion coefficient is calculated according to GOST 8.563-1997 or GOST 8.586-2005 respectively.

o keypad;

The operator entered keypad value is used in the flow calculation

- Orifice th. exp. mode (Orifice thermal expansion factor mode)
 - o calculated;

Selection list is opened and the material of the pipe can be selected from the list. See Table 9-10. Thermal expansion coefficient is calculated according to GOST 8.563-1997 or GOST 8.586-2005 respectively.

o keypad;

The operator entered keypad value is used in the flow calculation

- Temperature tappings; (Available only if flow standard is ISO 5167 (any edition))Selected from the list:
 - o upstream;
 - o downstream;

• Measured temperature correction;

Appears only if downstream temperature tapping is selected.

If enabled the in case of ISO5167:1991 flow standard isentropic correction, in case of ISO5167:1998 and ISO5167:2003 flow standard isenthalpic correction is applied to the temperature measured downstream to calculate the upstream temperature.

No measured temperature correction is applied in case of any other flow standard.

- Selected from the list:
 - o no; o yes;
- Pipe diameter pressure correction;

If enabled then the pipe diameter is corrected for the internal pressure before the thermal expansion calculation is applied.

Selected from the list:

- o no;
- o yes;

Pipe wall thickness; It is appears only if Pipe diameter pressure correction is enabled. Keypad value shall be entered.

• Pipe Young modulus;

It is appears only if Pipe diameter pressure correction is enabled. Keypad value shall be entered.

- Pipe wall roughness; It is appears only if Flow standard GOST 8.563 or GOST 8.586 is selected. Keypad value shall be entered.
- Orifice rounding radius; It is appears only if Flow standard GOST 8.563 or GOST 8.586 is selected. Keypad value shall be entered.
- Interval between checks; It is appears only if Flow standard GOST 8.563 or GOST 8.586 is selected. Keypad value shall be entered.
- Pressure transmitter level correction;

It compensates the hydrostatic pressure of the fluid in the pressure transmitter impulse line. The sign shall be: plus (+) if the pressure transmitter located above the pressure tapping points minus (-)if the pressure transmitter located below the pressure tapping points In case of gas flow measurement the level correction can be neglected. Keypad value shall be entered.

- Measured temperature correction;

Appears only if downstream temperature tapping is selected.

If enabled the in case of ISO5167:1991 flow standard isentropic correction, in case of ISO5167:1998 and ISO5167:2003 flow standard isenthalpic correction is applied to the temperature measured downstream to calculate the upstream temperature.

No measured temperature correction is applied in case of any other flow standard.

Selected from the list:

- o no;
- o yes;
- Pipe diameter pressure correction;

If enabled the then the pipe diameter is corrected for the internal pressure before the thermal expansion calculation is applied.

Selected from the list:

- o no;
- o yes;
- Pipe wall thickness; It is appears only if Pipe diameter pressure correction is enabled. Keypad value shall be entered.
- Pipe Young modulus; It is appears only if Pipe diameter pressure correction is enabled. Keypad value shall be entered.
- Pressure transmitter level correction;

It compensates the hydrostatic pressure of the fluid in the pressure transmitter impulse line. The sign shall be: plus (+) if the pressure transmitter located above the pressure tapping points minus (-) if the pressure transmitter located below the pressure tapping points In case of gas flow measurement the level correction can be neglected. Keypad value shall be entered.

P transmit.level corr.	0 mm

Figure 9-106 Flow meter with power characteristic data page

The equation of this type of flow meter implemented in UNIFLOW-200 is as follows:

 $q_V = MF \cdot (A \cdot J^n + B)$

- where: $q_{\rm V}$ volume flow rate, m^3/h
 - MF correction factor, -
 - A multiplier, -
 - n exponent, -
 - B bias, -
 - J input signal, %

The data fields on the data page are as follows:

• Correction factor;

A multiplier can be entered here to apply to the reading of the meter. Default value is 1.0.

- Calibration curve;
- Selected from the list:
 - o **no**;
 - o yes;

If calibration curve is enabled then maximum 10 input signal (%) and the corresponding multiplier can be entered here from the calibration certificate of the meter.

- Input signal n; (n = 1 to 10)
- Multiplier n; (n = 1 to 10)
- Exponent
- Bias;
- Pipe diameter at 20 oC;

Keypad value shall be entered.

• Pressure transmitter level correction;

9.2.2.1.2.7 Electric power meter

Route in the menu tree:

Parameters Streams Physical stream Stream 1. Flow meter Electric power meter
--

The "Electric power meter" flow meter selection is intended for electrical power measurement. In this case no flow calculation is required. Input signal from electric power meter is received and only totalization is performed, the electric power is totalized.

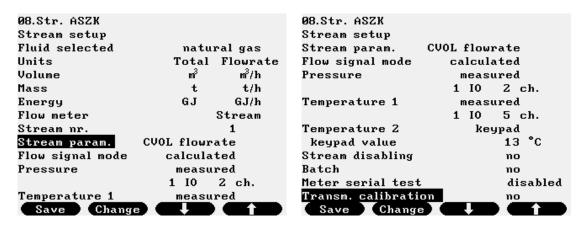

The unit for the input channel representing the flow rate (in case of the electrical power measurement) shall be selected as MW or MVA in this case.

The fluid shall be selected as "Electric power".

No data page will appear in this case. Message ""Fluid electric power selected" and "Electric power meter selected" will appear on the screen for fluid and flow meter selection respectively.

9.2.2.1.2.8 Stream

Route in the men	u tree:				
Parameters	Streams	Physical stream	Stream 1.	Flow meter	Stream

The "Stream" flow meter selection is intended for the case when the flow signal is set as volume at line or at base conditions or mass flow rate of any other stream. The assignment of the source stream is done in the Stream setup menu. Example of such measurement is the multi tariff measurement of the gas flow. It means that different flow rate ranges of the gas are totalized in different streams.

9.2.2.1.3 Stream setup

After the fluid and the flow meter are selected the stream setup procedure should be completed. In the Stream setup menu, the field I/O channels are assigned to the process parameters required in the flow calculation. Some additional parameters required for proper signal processing are entered also.

Depending on the fluid and the flow meter selected specific for that selection Stream setup data page will appear. The number of different fluids and the number of flow meters UNIFLOW-200 is capable to operate with is large. To list all the combinations of fluids and flow meters is not practical, if not impossible here.

Some typical data pages are shown below. They show all of the parameters that appear in setup procedure but maybe in different combination.

It is important to note that the signal setup completed in I/O signal setup section must be synchronized with the stream setup. It means that type of the signal and the unit of measurement selected for the signal must correspond to the signal and unit of measurement required in the flow calculation and the I/O channel assigned to.

The limitations listed below should be observed.

Flow signals:

- differential pressure devices and Annubar;
 - o unit: mbar;
 - o signal mode: 4-20 mA I/O channel, Modbus channel, keypad
- gas and liquid turbine meter, Vortex meter, ultrasonic meter, electromagnetic flow meter, CVOL flow meter
 - unit: m3/h (at line conditions, at base conditions in case of CVOL flow meter);
 - o signal mode: 4-20 mA I/O channel, pulse I/O channel, Modbus channel, keypad
- rotameter;
 - o unit: m3/h (at line conditions);
 - o signal mode: 4-20 mA I/O channel, Modbus channel, keypad
- mass flow meter;
 - o unit: kg/h;
 - o signal mode: 4-20 mA I/O channel, pulse I/O channel, Modbus channel, keypad
- flow meter with power characteristic;
 - o unit: %;
 - o signal mode: 4-20 mA I/O channel, Modbus channel, keypad

Pressure signal

- o unit: bar;
- o signal mode: 4-20 mA I/O channel, Modbus channel, keypad

Temperature signal

- o unit: oC;
- o signal mode: 4-20 mA I/O channel, Pt100 I/O channel, Modbus channel, keypad

Density signal

- o unit: kg/m3;
- o signal mode: 4-20 mA I/O channel, frequency I/O channel, Modbus channel, keypad

Calorific value signal

- o unit: MJ/m3 or kg/m3;
- o signal mode: 4-20 mA I/O channel, Modbus channel, keypad

Concentration signal

- o unit: % (percent);
- o signal mode: 4-20 mA I/O channel, Modbus channel, keypad

Duplicated pressure and temperature signals

Uniflow-200 supports duplicated signal assignment to pressure and temperature process parameters. The mode for the pressure and temperature process parameters is selected from the list:

- keypad;
 Fixed value is used in the calculation
- measured;
 Signal measured at single input channel (4-20 mA or PRT/RTD or HART) is used in the calculation.
- Modbus signal;

Signal received in single Modbus register is used in the calculation.

• Measured 1-2;

Two input channels are assigned to the parameter. First channel is the duty, the second is the stand-by channel. In case if duty channel fails the signal from stand-by channel goes to the calculation.

If both duty and standby signal fail, the keypad value of the duty signal goes to the calculation. Signals from the two channels are continuously compared. If the deviation between the channels higher than the preset limit, and the deviation exists for period longer than the deviation timeout, then alarm is raised.

- Channel numbers and the deviation limit should be entered
- Signal 1 IO n Ch m1
 Signal 2 IO n Ch m2 n – number of I/O board m – number of channel on the I/O board
 - Deviation limit (in % of the signal range)
- Deviation timeout (in s)
- Modbus 1-2;

Two Modbus channels are assigned to the parameter. First channel is the duty, the second is the stand-by channel. In case if duty channel fails the signal from stand-by channel goes to the calculation.

If both duty and standby signal fail, the keypad value of the duty signal goes to the calculation.

Signals from the two channels are continuously compared. If the deviation between the channels higher then the preset limit, and the deviation exists for period longer than the deviation timeout, then alarm is raised.

Channel numbers and the deviation limit should be entered

- Channel 1 n1
- Channel 2 *n2*
- n number of Modbus channel
- Deviation limit (in % of the signal range)
- Deviation timeout (in s)
- Average 1-2;

Two input channels are assigned to the parameter. The average of the two signals goes to the calculation. If one of the channels is failed, the signal from the healthy channel goes to the calculation.

If both signals fail, the keypad value of the first signal goes to the calculation.

Signals from the two channels are continuously compared. If the deviation between the channels higher than the preset limit, and the deviation exists for period longer than the deviation timeout, then alarm is raised.

Channel numbers and the deviation limit should be entered

- Signal 1 IO n Ch m1
 Signal 2 IO n Ch m2
 n number of I/O board
- m number of channel on the I/O board
- Deviation limit (in % of the signal range)
- Deviation timeout (in s)
- Average Modbus 1-2;

Two Modbus channels are assigned to the parameter. The average of the two signals goes to the calculation. If one of the channels is failed, the signal from the healthy channel goes to the calculation.

If both signals fail, the keypad value of the first signal goes to the calculation.

Signals from the two channels are continuously compared. If the deviation between the channels higher than the preset limit, and the deviation exists for period longer than the deviation timeout, then alarm is raised.

Channel numbers and the deviation limit should be entered

- Channel 1 n1
- Channel 2 *n2*

n – number of Modbus channel

- Deviation limit (in % of the signal range)
- Deviation timeout (in s)

In the Stream setup menu, the unit of measurement for volume, mass and energy shall be selected. In the Table 9-11. below the available units are listed for both metric and imperial systems.

Fluid	Quantity	Metric units	Metric units		Imperial units	
		Total	Flow rate	Total	Flow rate

Figure 9-109 Stream disabling and transmitter calibration data page

The data fields on the data page are as follows:

- Fluid selected;
- Not editable here, fixed to the fluid selected in the Fluid menu
- Units;
 - See the available units for volume, mass and energy in Table 9-11.
- Flow meter;
 - Not editable here, fixed to the flow meter selected in the Flow meter menu
- Flow signal mode;
 - The mode selected from the list
 - o measured;
 - It is assumed that differential pressure is measured on input channel(s). In this case new data entry fields appear to enter the dP transmitter parameters.

- No. of dP transm. (Number of dP transmitters); Selected from the list;
 - 1 (one differential pressure transmitter);
 - The I/O channel measuring the differential pressure is entered.
 - dP1 IO *n* Ch *m*
 - n number of I/O board
 - *m* number of channel on the I/O board
 - 2 (two differential pressure transmitters);
 - The configuration of the dP transmitters in case of 2 transmitters:
 - dP stack type
 - Selected from the list
 - LH (low and high range dP transmitters);

The low or high transmitter reading is used in the flow calculation, depending on the differential pressure measured and the switch down and switch up limits.

- The I/O channels measuring the differential pressure is entered.
- dP1L IO *n* Ch *m* - dP2H IO *n* Ch *m*
- n number of I/O board
 - *m* number of channel on the I/O board
- Switch up
 - Switch from low range to high range transmitter in % of the low range transmitter upper range.
- Switch down
 - Switch from high range to low range transmitter in % of the low range transmitter upper range.
- HH (two transmitters with identical range);

The average of the two transmitters reading is used in the flow calculation.

The I/O channels measuring the differential pressure is entered.

- dP1H IO *n* Ch *m*
- dP2H IO *n* Ch *m*
- *n* number of I/O board
 - m number of channel on the I/O board
- discrepancy (in % of the transmitter range);
- Maximum deviation between the readings of the two transmitters.
- discrepancy timeout (in seconds)
- If the discrepancy exists longer then this timeout time, then alarm is raised.
- 3 (three differential pressure transmitters);
 - The configuration of the dP transmitters in case of 3 transmitters:
 - dP stack type
 - Selected from the list
 - LMH (low, medium and high range dP transmitters);
 - The low or medium or high range transmitter reading is used in the flow calculation,

depending on the differential pressure measured and the switch down and switch up limits. The I/O channels measuring the differential pressure is entered.

- dP1L IO *n* Ch *m*
 - dP2M IO *n* Ch *m*
 - dP3H IO *n* Ch *m*
 - *n* number of I/O board
 - m number of channel on the I/O board
- Switch up

Switch from low range to medium range transmitter in % of the low range transmitter upper range. Switch from medium range to high range transmitter in % of the medium range transmitter upper range.

- Switch down
 - Switch from high range to medium range transmitter in % of the medium range transmitter upper range. Switch from medium range to low range transmitter in % of the low range transmitter upper range.
- LHH (one low range and two high range transmitters);

The low or high transmitter reading is used in the flow calculation, depending on the differential pressure measured and the switch down and switch up limits. The average of the two high range transmitters reading is used as high dP reading. The I/O channels measuring the differential pressure is entered.

- dP1L
- dP2H 10 *n* Ch m
- dP3H 10 *n* Ch m
- n-number of I/O board

m – number of channel on the I/O board

10 n

- Switch up Switch from low range to high range transmitter in % of the low range transmitter upper range.
- Switch down
- Switch from high range to low range transmitter in % of the low range transmitter upper range.
- discrepancy (in % of the transmitter range);
- Maximum deviation between the readings of the two high range transmitters. discrepancy timeout (in seconds)

Ch m

- If the discrepancy exists longer then this timeout time, then alarm is raised.
- HHH (three transmitters with identical range);

The average of the three transmitters reading is used in the flow calculation if all the discrepancies are within the limit.

The mid reading is used in the flow calculation if all the discrepancies are outside the limit. The average of the two closest readings are used in the flow calculation in all other cases. The I/O channels measuring the differential pressure is entered.

- dP1H 10 *n* Ch m
- dP2H 10 *n* Ch m
- dP3H 10 *n* Ch m
 - n number of I/O board
 - m number of channel on the I/O board
- discrepancy (in % of the transmitter range);
 - Maximum deviation between the readings of any two transmitters.
- discrepancy timeout (in seconds)
 - If the discrepancy exists longer then this timeout time, then alarm is raised.
- modbus sign.; 0

It is assumed that differential pressure signal is received on Modbus channel.

In this case new data entry field appear to enter the dP channel parameters.

- Channel
 - n *n* – number of Modbus channel;
- keypad;

Keypad flow signal (differential pressure) can be entered here. It serves for testing the flow calculation only. NOTE

If flow signal is set to keypad the flow rate will be displayed but no totalization will be done.

dP cut off;

0

Entered in % of the low range transmitter.

If the measured differential pressure is below the dP cut off limit then the differential pressure is assumed to be zero. Eventing dP cut off:

- It is operator selectable if the dP cut off will generate entry in the event log or not.
 - 0 yes;
- 0 no;
- Pressure signal mode:

The mode selected from the list (for duplicated pressure signals see 9.2.2.1.3.)

- measured: 0
 - It is assumed that pressure is measured on input channel.

The channel number should be entered here.

- IO nCh m
- n-number of I/O board
- *m* number of channel on the I/O board
- modb. sign.;

It is assumed that pressure signal is received on Modbus channel.

The channel number should be entered here.

- Channel n;
- n-number of Modbus channel;
- keypad; 0

Keypad pressure can be entered here if pressure signal is not available.

- Temperature signal mode:
 - The mode selected from the list (for duplicated temperature signals see 9.2.2.1.3.)
 - measured; 0
 - It is assumed that temperature is measured on input channel.
 - The channel number should be entered here.
 - 10 *n* Ch m
 - n number of I/O board
 - m number of channel on the I/O board
 - modb. sign.; 0
 - It is assumed that temperature signal is received on Modbus channel.
 - The channel number should be entered here.
 - Channel
 - n: *n* – number of Modbus channel;
 - keypad; 0
 - Keypad temperature can be entered here if temperature signal is not available.
 - Ambient temp. signal mode;

Ambient temp. is intended for ambient temperature measurement.

It is not used in flow calculation.

The mode selected from the list

o measured;

-

- It is assumed that temperature is measured on input channel.
- The channel number should be entered here.
 - 10 *n* Ch m
 - n-number of I/O board
 - *m* number of channel on the I/O board
- modb. sign.; 0

It is assumed that temperature signal is received on Modbus channel. The channel number should be entered here.

- Channel
 - *n* number of Modbus channel;

n:

keypad; 0

Keypad temperature can be entered here if temperature signal is not available. Live it to keypad value if no ambient temperature measurement is required.

Stream disabling;

It is possible to disable the operation of the stream depending on different parameters. The option is selected from the list:

0 no:

0

- Stream never disabled.
- input signal;

Any I/O channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none

The channel number and the limit causing the stream disabled should be entered here.

- 10 *n* Ch m:
 - n number of I/O board

m – number of channel on the I/O board

Limit to disable:

- Lower limit
 - (low alarm limit of the I/O channel); lo
 - (low-low alarm limit of the I/O channel); lolo
 - (low scale of the I/O channel); lsc
 - (no lower limit will disable the stream); _

Upper limit

- hi (high alarm limit of the I/O channel);
- (high-high alarm limit of the I/O channel); hihi
- (high scale of the I/O channel): hsc
- (no upper limit will disable the stream):
- modbus signal;

Any Modbus channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The channel number and the limit causing the stream disabled should be entered here.

- Channel n;
 - *n* number of Modbus channel;
 - Limit to disable;
 - Lower limit
 - lo (low alarm limit of the Modbus channel);
 - lolo (low-low alarm limit of the Modbus channel);
 - lsc (low scale of the Modbus channel);
 - (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- (no upper limit will disable the stream);
- o from stream;

Any stream can be selected.

One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The stream number and the limit causing the stream disabled should be entered here.

- Stream n;
 - n serial number of the stream from 1 to 12;
- Limit to disable;

Lower limit

- 10 (low alarm limit of the Stream *n*);
- lolo (low-low alarm limit of the Stream n);
- lsc (low scale of the Stream n);
- (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- (no upper limit will disable the stream);

The values of the upper and lower limits are set in the Limits menu of the Stream *n* being the stream disabling the current stream. The type of flow rate (volume at line or at base conditions, mass or energy flow rate) is selected also in the Limits menu of the Stream *n*. See 9.2.2.1.5.

Batch;

Batch measurement is enabled or disabled here.

The option is selected from the list:

o no;

No batch measurement performed.

o yes;

Batch measurement is enabled. New data entry lines appear where the parameters of the batch measurement shall be entered.

Batch start/stop

The batch start/stop method is selected here from the list of options:

- from communication interface;

The batch measurement starts and stops by writing certain Modbus registers. The mapping of the start/stop Modbus registers and also the registers where the measured data can be read from see in 10.5.2.

- start key/required quantity;

The batch measurement starts with pulse (pulse length min. 1 s) applied to the appropriate digital input. The batch measurements stops when the required quantity (mass or volume) passed the meter run. The batch measurement can be stopped in case of emergency applying pulse (pulse length min. 1 s) to the appropriate digital input.

In case of this start/stop method, new data entry lines appear as follows:

- Required quantity
- Selected from the list:

•

- uncorr. volume (required quantity is entered in volume units at line conditions);
- mass (required quantity is entered in mass units);
 - Batch quantity
- Numeric entry field to enter the required batch quantity.

- Batch start input (digital input channel to start batch measurement)
- IO *n* Ch *m*

n – number of I/O board

m – number of channel on the I/O board

- Batch stop input (digital input channel to stop batch measurement in case of emergency)
 IO n Ch m
- *n* number of I/O board

m – number of channel on the I/O board

- Batch control input (digital output channel set to active state during the batch
 - measurement)
 - IO n Ch m
- n-number of I/O board

m – number of channel on the I/O board

- daily batch measurement;

The batch measurement starts at the defined hour of day and lasts 24 hours (one day). After one day finished the batch measurement for the next day starts automatically. Batch report generated after each day. By this setting second set of daily counters can be defined, which are independent from the standard daily counters and the start hour of this daily batch is also independent from the general starting hour of the day.

In case of this start/stop method, new data entry lines appear as follows:

- Start hour of daily batch
- Numeric entry field to enter the start hour of the daily batch measurement. Valid entries are from 0 to 23.
- Batch type

The type of batch measurement is selected here from the list of options:

- Tank loading/unloading;
- Conventional tank loading batch measurement (see 9.1.7.1).
- Pipeline product interface;

Different kind of fluids flowing in the same pipeline each after other measured as batches (see 9.1.7.2).

Available only if batch start/stop method is "from communication interface".

In case to Pipeline product interface batch type new data entry line appear:

Product info

Entering into this entry line new data entry display appears where up to 16 different product type and the corresponding density at base conditions shall be entered. See also in 9.2.2.1.1.5. Liquids.

The name of the stream entered in 9.2.2.1. will be displayed on the batch report as station name. To display the results of the batch measurements, see 9.1.7.

Meter serial test

Flow meter serial test measurement can be enabled or disabled here. The option is selected from the list:

o disabled;

No flow meter serial test measurement performed.

o meter serial test;

Flow meter serial test measurement is enabled.

Serial test can be enabled on Stream 1 only.

Warning message appears:

Proceeding will reset all totals and parameters of stream 8. Proceed?

- Selecting yes two new lines appear.
 - Shadow stream 8

In the non-custody transfer flow computer, the measured values and totals are displayed in stream 8. Stream

- The option is selected from the list:
 - custody transfer stream (slave);
 The stream being set up will perform the custody transfer measurement during the serial test. It will operate in normal way. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the slave device.
 - non custody transfer stream (master);

The stream being set up will perform non custody transfer measurement during the serial test. It will display and totalize the flow in stream 8 instead of the stream being configured for the particular meter run. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the master device.

- o flow computer calibration;
 - The flow computer calibration is a special subset of the meter serial test.
 - Selecting this option:
 - the stream 8 will be the shadow stream;
 - Uniflow-200 will be the Master device in the calibration.

See details of the meter serial test measurements and the flow computer calibration in 9.1.8.

Transmitter calibration

Calibration of the transmitters can be enabled or disabled here. When calibration is enabled for a certain transmitter keypad value shall be entered for the parameter being measured by that transmitter. In this case, the flow calculation will be performed with the keypad value of the parameter. The measured value of the input signal is still displayed in the Flow / Plant I/O / IO Board x menu allowing the calibration of the transmitter without interrupting the flow measurement. NOTE: the transmitter calibration shall be disabled after finishing the transmitter calibration to recover the normal operation of the flow computer.

The option is selected from the list:

- o no;
 - transmitters operate in normal way.
- o yes;

transmitters are being calibrated. If the yes option is selected 4 new menu item appears allowing selection of the transmitters one by one, namely:

- Flow meter
 - o no;
 - flow meter operates in normal way.
 - o yes;
 - flow meter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Pressure
 - o no;

pressure transmitter operates in normal way.

- o yes;
 - pressure transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature
 - o no;
 - temperature 1 transmitter operates in normal way.
 - o yes;
 - temperature 1 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Ambient temp.
 - o no;
 - ambient temp. transmitter operates in normal way.
 - o yes;
 - temperature 2 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.

9.2.2.1.3.2 Stream setup example – fluid: natural gas, flow meter: turbine meter

Ro	ute in the menu tree:			
Parameters	Streams	Physical stream	Stream 1.	Stream set up

02.Str. ASZK2			02.Str.ASZK2		
Stream setup			Stream setup

Figure 9-110 Stream setup data page, fluid: natural gas, flow meter: turbine meter

The data fields on the data page are as follows:

- Fluid selected: •
 - Not editable here, fixed to the fluid selected in the Fluid menu
- Units:
 - See the available units for volume, mass and energy in Table 9-11.
- Flow meter: •
 - Not editable here, fixed to the flow meter selected in the Flow meter menu
- Flow signal mode;
 - The mode selected from the list
 - o measured;
 - It is assumed that flow signal is measured on input channel(s).
 - Valid input channels for selection:
 - high frequency input channels (pulse input channels of PDIO484 or PITC4641 board)
 - digital input channels with signal type set to "Pulse" (digital input channels of PDIO484, PITC4641 and AODIO484 boards)

In this case the I/O channel measuring the flow signal shall be entered.

- IO nCh m
 - n number of I/O board
 - m number of channel on the I/O board
- modb. sign.; 0

It is assumed that flow signal is received on Modbus channel..

In this case new data entry field appear to enter the flow signal channel parameters.

- Channel
 - n *n*-number of Modbus channel;
- keypad; 0

Keypad flow signal can be entered here. It serves for testing the flow calculation only. NOTE

If flow signal is set to keypad the flow rate will be displayed but no totalization will be done.

Check signal mode:

Check signal mode entry field appears in the next line.

The mode selected from the list

- 0 no;
 - No check signal (second pulse train from the turbine meter) exists.
 - measured;

In this case the I/O channel measuring the check signal shall be entered.

- IO n Ch m
 - n number of I/O board

m – number of channel on the I/O board

Signal ratio;

0

The ratio of the Main signal frequency to the Check signal frequency shall be entered here.

Cut off:

Entered in % of the maximum UVOL flow rate as defined in the signal setup menu.

If the measured flow rate is below the Cut off limit then the flow rate is assumed to be zero.

Eventing cut off:

It is operator selectable if the Cut off will generate entry in the event log or not.

- o yes;
- o no;

- Pressure signal mode;
 - The mode selected from the list (for duplicated pressure signals see 9.2.2.1.3.)
 - measured: 0
 - It is assumed that pressure is measured on input channel.

The channel number should be entered here.

- 10 *n* Ch m
 - *n* number of I/O board
 - m number of channel on the I/O board
- modb. sign.; 0
 - It is assumed that pressure signal is received on Modbus channel.
 - The channel number should be entered here.
 - Channel
 - n: *n* – number of Modbus channel;
- keypad; 0
 - Keypad pressure can be entered here if pressure signal is not available.
- Temperature signal mode:
- The mode selected from the list (for duplicated temperature signals see 9.2.2.1.3.)
 - measured; 0
 - It is assumed that temperature is measured on input channel.

The channel number should be entered here.

- 10 *n* Ch m
- n number of I/O board
- m number of channel on the I/O board
- modb. sign.; 0

It is assumed that temperature signal is received on Modbus channel.

- The channel number should be entered here.
- Channel _
 - n; *n*-number of Modbus channel;
- keypad;
 - Keypad temperature can be entered here if temperature signal is not available.
- Ambient temp. signal mode:
- Ambient temp. is intended for ambient temperature measurement.

It is not used in flow calculation.

The mode selected from the list

- o measured;
 - It is assumed that temperature is measured on input channel. The channel number should be entered here.
 - 10 *n* Ch m
 - n number of I/O board

 - m number of channel on the I/O board
- modb. sign.; 0

It is assumed that temperature signal is received on Modbus channel. The channel number should be entered here.

- - Channel _ n:
 - *n* number of Modbus channel:
- keypad; 0

Keypad temperature can be entered here if temperature signal is not available. Live it to keypad value if no ambient temperature measurement is required.

LF (low frequency) pulse counter

Available only if flow signal mode is "measured".

For the metering streams having high frequency flow signals from volume flow meters or mas flow meters an LF counter can be defined. E. g. in case of turbine meter the low frequency pulse output connected to digital input channel, can be assigned to the LF counter of the stream.

The LF counter has only cumulative total counter, it has no periodic total counters.

LF pulse cumulative total counter is available (if defined)

- on cumulative totals data page;
- on the Snapshot report;

- on the Modbus Slave channel when Daniel Modbus or User Modbus is defined (not available in standard Modbus);

- on User defined reports (defined report 11 to 18.

The aim of this counter is to repeat the mechanical counter located in the counter head of the turbine meter. The K-factor of the low frequency output shall be set in the signal setup page of the digital input, the LF output connected to. So that the LF counter will repeat the volume/mass indicated on the meter counter.

It is not used in flow calculation.

The mode selected from the list

o measured;

It is assumed that low frequency signal is measured on input channel.

The channel number should be entered here.

IO n Ch m

n – number of I/O board

m – number of channel on the I/O board

o no;

No LF signal is connected, no LF pulse counter will be available.

Stream disabling;

It is possible to disable the operation of the stream depending on different parameters. The option is selected from the list:

o no:

- Stream never disabled.
- o input signal;

Any I/O channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none

The channel number and the limit causing the stream disabled should be entered here.

- IO *n* Ch *m*;
 - *n* number of I/O board

m – number of channel on the I/O board

- Limit to disable;
 - Lower limit
 - 10 (low alarm limit of the I/O channel);
 - lolo (low-low alarm limit of the I/O channel);
 - lsc (low scale of the I/O channel);
 - (no lower limit will disable the stream);
 - Upper limit
 - hi (high alarm limit of the I/O channel);
 - hihi (high-high alarm limit of the I/O channel);
 - hsc (high scale of the I/O channel);
 - (no upper limit will disable the stream);
- o modbus signal;

Any Modbus channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

- The channel number and the limit causing the stream disabled should be entered here.
- Channel n;
 - *n* number of Modbus channel;
 - Limit to disable;
 - Lower limit
 - 10 (low alarm limit of the Modbus channel);
 - 1010 (low-low alarm limit of the Modbus channel);
 - lsc (low scale of the Modbus channel);
 - (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- (no upper limit will disable the stream);
- o from stream;
 - Any stream can be selected.

One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

- The stream number and the limit causing the stream disabled should be entered here.
- Stream *n*;
 - n serial number of the stream from 1 to 12;
- Limit to disable;

Lower limit

- 10 (low alarm limit of the Stream *n*);
- lolo (low-low alarm limit of the Stream n);
- lsc (low scale of the Stream n);
- (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- (no upper limit will disable the stream);

The values of the upper and lower limits are set in the Limits menu of the Stream n being the stream disabling the current stream. The type of flow rate (volume at line or at base conditions, mass or energy flow rate) is selected also in the Limits menu of the Stream n. See 9.2.2.1.5.

Batch;

Batch measurement is enabled or disabled here.

The option is selected from the list:

- o no;
 - No batch measurement performed.
- o yes;

Batch measurement is enabled. New data entry lines appear where the parameters of the batch measurement shall be entered.

Batch start/stop

The batch start/stop method is selected here from the list of options:

- from communication interface;

The batch measurement starts and stops by writing certain Modbus registers. The mapping of the start/stop Modbus registers and also the registers where the measured data can be read from see in 10.5.2.

- start key/required quantity;

The batch measurement starts with pulse (pulse length min. 1 s) applied to the appropriate digital input. The batch measurements stops when the required quantity (mass or volume) passed the meter run. The batch measurement can be stopped in case of emergency applying pulse (pulse length min. 1 s) to the appropriate digital input.

In case of this start/stop method, new data entry lines appear as follows:

Required quantity

Selected from the list:

uncorr. volume (required quantity is entered in volume units at line conditions);

- mass (required quantity is entered in mass units);
- Batch quantity

Numeric entry field to enter the required batch quantity.

- Batch start input (digital input channel to start batch measurement)
- IO *n* Ch *m*

n – number of I/O board

m – number of channel on the I/O board

Batch stop input (digital input channel to stop batch measurement in case of emergency)
 IO n Ch m

n – number of I/O board

m – number of channel on the I/O board

- Batch control input (digital output channel set to active state during the batch measurement)
- IO n Ch m
- n number of I/O board
- m- number of channel on the I/O board

- daily batch measurement;

The batch measurement starts at the defined hour of day and lasts 24 hours (one day). After one day finished the batch measurement for the next day starts automatically. Batch report generated after each day. By this setting second set of daily counters can be defined, which are independent from the standard daily counters and the start hour of this daily batch is also independent from the general starting hour of the day.

In case of this start/stop method, new data entry lines appear as follows:

Start hour of daily batch

Numeric entry field to enter the start hour of the daily batch measurement. Valid entries are from 0 to 23.

Batch type

The type of batch measurement is selected here from the list of options:

- Tank loading/unloading;
- Conventional tank loading batch measurement (see 9.1.7.1).
- Pipeline product interface;
- Different kind of fluids flowing in the same pipeline each after other measured as batches (see 9.1.7.2).
- Available only if batch start/stop method is "from communication interface".

In case to Pipeline product interface batch type new data entry line appear:

Product info

Entering into this entry line new data entry display appears where up to 16 different product type and the corresponding density at base conditions shall be entered. See also in 9.2.2.1.1.5. Liquids.

The name of the stream entered in 9.2.2.1. will be displayed on the batch report as station name. To display the results of the batch measurements, see 9.1.7.

Meter serial test

Flow meter serial test measurement can be enabled or disabled here. Serial test can be enabled on Stream 1 only. The option is selected from the list:

o disabled;

•

- No flow meter serial test measurement performed.
- meter serial test;

Flow meter serial test measurement is enabled.

Serial test can be enabled on Stream 1 only.

Warning message appears:

Proceeding will reset all totals and parameters of stream 8. Proceed?

Selecting yes two new lines appear.

- Shadow stream 8
 - In the non custody transfer flow computer the measured values and totals are displayed in stream 8. Stream
 - The option is selected from the list:
 - custody transfer stream (slave);
 - The stream being set up will perform the custody transfer measurement during the serial test. It will operate in normal way. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the slave device.
 - non custody transfer stream (master);

The stream being set up will perform non custody transfer measurement during the serial test. It will display and totalize the flow in stream 8 instead of the stream being configured for the particular meter run. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the master device.

o flow computer calibration;

The flow computer calibration is a special subset of the meter serial test. Selecting this option:

- the stream 8 will be the shadow stream;
- Uniflow-200 will be the Master device in the calibration.

See details of the meter serial test measurements and the flow computer calibration in 9.1.8.

• Transmitter calibration

Calibration of the transmitters can be enabled or disabled here. When calibration is enabled for a certain transmitter keypad value shall be entered for the parameter being measured by that transmitter. In this case the flow calculation will be performed with the keypad value of the parameter. The measured value of the input signal is still displayed in the Flow / Plant I/O / IO Board x menu allowing the calibration of the transmitter without interrupting the flow measurement. NOTE: the transmitter calibration shall be disabled after finishing the transmitter calibration to recover the normal operation of the flowcomputer.

The option is selected from the list::

o no;

0

- transmitters operate in normal way.
- yes;

transmitters are being calibrated. If the yes option is selected 4 new menu item appears allowing selection of the transmitters one by one, namely:

- Flow meter
 - o no;
 - flow meter operates in normal way.
 - o yes;
- flow meter is being calibrated.
- Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Pressure

0

- no;
- pressure transmitter operates in normal way.
- o yes;
 - pressure transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature
 - o no;
 - temperature 1 transmitter operates in normal way.
 - o yes;
 - temperature 1 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Ambient temp.
 - o no;
 - ambient temp. transmitter operates in normal way.
 - o yes;
 - ambient temp. transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.

9.2.2.1.3.3 Stream setup example – fluid: natural gas, flow meter: ultrasonic meter

Route in the menu tree:

Parameters	Streams	Physical stream	Stream 1.	Stream setup
------------	---------	-----------------	-----------	--------------

Figure 9-111 Stream setup data page, fluid: natural gas, flow meter: ultrasonic meter

The data fields on the data page are as follows:

- Fluid selected;
- Not editable here, fixed to the fluid selected in the Fluid menu
- Units; See the available units for volume, mass and energy in Table 9-11.Flow meter selected; Not editable here, fixed to the flow meter selected in the Flow meter menu

• Flow signal mode;

The mode selected from the list

- o measured;
 - It is assumed that the flow signal is measured on analog input channel.
 - The channel number entered here.
 - IO *n* Ch *m*;
 - *n* number of I/O board
 - m number of channel on the I/O board
- o modb. sign. (measured at Modbus channel);

It is assumed that the flow signal is received on Modbus channel. This is the case when UNIFLOW-200 reads volume flow rate data from ultrasonic meter on modbus link.

- In this case new data entry field appear to enter the flow signal channel parameters.
- Channel *n*;
 - *n* number of Modbus channel;
- o keypad;

Keypad flow signal (volume flow rate at line conditions) can be entered here. It serves for testing the flow calculation only.

NOTE

If flow signal is set to keypad the flow rate will be displayed but no totalization will be done.

• Cut off (Low flow cut off);

Entered in % of the high range of the flow signal input channel.

If the measured flow is below the low flow cut off limit then the flow is assumed to be zero.

- Eventing low flow cut off;
- It is operator selectable if the low flow cut off will generate entry in the event log or not.
 - o yes;

o no;

Pressure signal mode;

The mode selected from the list (for duplicated pressure signals see 9.2.2.1.3.)

- o measured;
 - It is assumed that pressure is measured on input channel.
 - The channel number should be entered here.
 - IO n Ch m
 - n number of I/O board
 - m number of channel on the I/O board
- o modb. sign. (measured at Modbus channel);
 - It is assumed that pressure signal is received on Modbus channel.

The channel number should be entered here.

- Channel *n*; *n* – number of Modbus channel;
- o keypad;

Keypad pressure can be entered here if pressure signal is not available.

• Temperature1 signal mode;

The mode selected from the list (for duplicated temperature signals see 9.2.2.1.3.)

- o measured;
 - It is assumed that temperature is measured on input channel.

The channel number should be entered here.

- IO n Ch m
- n number of I/O board
- *m* number of channel on the I/O board
- modb. sign. (measured at Modbus channel);
 - It is assumed that temperature signal is received on Modbus channel. The channel number should be entered here.
 - Channel *n*;
 - n- number of Modbus channel;
- o keypad;
 - Keypad temperature can be entered here if temperature signal is not available.
- Ambient temp. signal mode;

Ambient temp. is intended for ambient temperature measurement.

- It is not used in flow calculation.
- The mode selected from the list
 - o measured;
 - It is assumed that temperature is measured on input channel. The channel number should be entered here.

n – number of I/O board

m – number of channel on the I/O board

modb. sign.;

It is assumed that temperature signal is received on Modbus channel.

The channel number should be entered here.

- Channel *n*;
 - *n* number of Modbus channel;
- o keypad;

Keypad temperature can be entered here if temperature signal is not available.

Live it to keypad value if no ambient temperature measurement is required.

• Stream disabling;

0

It is possible to disable the operation of the stream depending on different parameters. The option is selected from the list:

- ne option is selected tr
- o no;
 - Stream never disabled.
- o input signal;

Any I/O channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none

The channel number and the limit causing the stream disabled should be entered here.

- IO *n* Ch *m*;
 - n number of I/O board
 - m number of channel on the I/O board
- Limit to disable;
- Lower limit
 - 10 (low alarm limit of the I/O channel);
 - lolo (low-low alarm limit of the I/O channel);
 - lsc (low scale of the I/O channel);
 - (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the I/O channel);
- hihi (high-high alarm limit of the I/O channel);
- hsc (high scale of the I/O channel);
 - (no upper limit will disable the stream);
- o modbus signal;

Any Modbus channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The channel number and the limit causing the stream disabled should be entered here.

- Channel n;
 - n number of Modbus channel;
 - Limit to disable;
 - Lower limit
 - 10 (low alarm limit of the Modbus channel);
 - lolo (low-low alarm limit of the Modbus channel);
 - lsc (low scale of the Modbus channel);
 - (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- (no upper limit will disable the stream);
- o from stream;
 - Any stream can be selected.

One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The stream number and the limit causing the stream disabled should be entered here.

- Stream n;

n – serial number of the stream from 1 to 12;

Limit to disable;

- Lower limit

- -1_0 (low alarm limit of the Stream *n*);
 - 1010 (low-low alarm limit of the Stream *n*);
 - lsc (low scale of the Stream n);
 - no lower limit will disable the stream);
- Upper limit
- hi (high alarm limit of the Stream n);
- hihi (high-high alarm limit of the Stream n;
- hsc (high scale of the Stream n);
 - (no upper limit will disable the stream);

The values of the upper and lower limits are set in the Limits menu of the Stream n being the stream disabling the current stream. The type of flow rate (volume at line or at base conditions, mass or energy flow rate) is selected also in the Limits menu of the Stream n. See 9.2.2.1.5.

Batch;

Batch measurement is enabled or disabled here.

The option is selected from the list:

o no;

No batch measurement performed.

o yes;

Batch measurement is enabled. New data entry lines appear where the parameters of the batch measurement shall be entered.

Batch start/stop

The batch start/stop method is selected here from the list of options:

- from communication interface;

The batch measurement starts and stops by writing certain Modbus registers. The mapping of the start/stop Modbus registers and also the registers where the measured data can be read from see in 10.5.2.

- start key/required quantity;

The batch measurement starts with pulse (pulse length min. 1 s) applied to the appropriate digital input. The batch measurements stops when the required quantity (mass or volume) passed the meter run. The batch measurement can be stopped in case of emergency applying pulse (pulse length min. 1 s) to the appropriate digital input.

In case of this start/stop method, new data entry lines appear as follows:

Required quantity

Selected from the list:

uncorr. volume (required quantity is entered in volume units at line conditions);

- mass (required quantity is entered in mass units);
- Batch quantity

Numeric entry field to enter the required batch quantity.

- Batch start input (digital input channel to start batch measurement)
- IO *n* Ch *m*

n – number of I/O board

m – number of channel on the I/O board

Batch stop input (digital input channel to stop batch measurement in case of emergency)
 IO n Ch m

n – number of I/O board

m – number of channel on the I/O board

- Batch control input (digital output channel set to active state during the batch measurement)
- IO *n* Ch *m*
- n number of I/O board
- m-number of channel on the I/O board

- daily batch measurement;

The batch measurement starts at the defined hour of day and lasts 24 hours (one day). After one day finished the batch measurement for the next day starts automatically. Batch report generated after each day. By this setting second set of daily counters can be defined, which are independent from the standard daily counters and the start hour of this daily batch is also independent from the general starting hour of the day.

In case of this start/stop method, new data entry lines appear as follows:

Start hour of daily batch

Numeric entry field to enter the start hour of the daily batch measurement. Valid entries are from 0 to 23.

Batch type

The type of batch measurement is selected here from the list of options:

- Tank loading/unloading;
- Conventional tank loading batch measurement (see 9.1.7.1).
- Pipeline product interface;
- Different kind of fluids flowing in the same pipeline each after other measured as batches (see 9.1.7.2).
- Available only if batch start/stop method is "from communication interface".

In case to Pipeline product interface batch type new data entry line appear:

Product info

Entering into this entry line new data entry display appears where up to 16 different product type and the corresponding density at base conditions shall be entered. See also in 9.2.2.1.1.5. Liquids.

The name of the stream entered in 9.2.2.1. will be displayed on the batch report as station name. To display the results of the batch measurements see 9.1.7.

Meter serial test

Flow meter serial test measurement can be enabled or disabled here.

The option is selected from the list::

o disabled;

•

No flow meter serial test measurement performed.

o meter serial test;

Flow meter serial test measurement is enabled.

Serial test can be enabled on Stream 1 only.

Warning message appears:

Proceeding will reset all totals and parameters of stream 8. Proceed?

Selecting yes two new lines appear.

- Shadow stream 8
 - In the non custody transfer flow computer the measured values and totals are displayed in stream 8. Stream
 - The option is selected from the list:
 - custody transfer stream (slave);

The stream being set up will perform the custody transfer measurement during the serial test. It will operate in normal way. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the slave device.

non custody transfer stream (master);

The stream being set up will perform non custody transfer measurement during the serial test. It will display and totalize the flow in stream 8 instead of the stream being configured for the particular meter run. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the master device.

o flow computer calibration;

The flow computer calibration is a special subset of the meter serial test. Selecting this option:

- the stream 8 will be the shadow stream;
- Uniflow-200 will be the Master device in the calibration.

See details of the meter serial test measurements and the flow computer calibration in 9.1.8.

Transmitter calibration

Calibration of the transmitters can be enabled or disabled here. When calibration is enabled for a certain transmitter keypad value shall be entered for the parameter being measured by that transmitter. In this case the flow calculation will be performed with the keypad value of the parameter. The measured value of the input signal is still displayed in the Flow / Plant I/O / IO Board x menu allowing the calibration of the transmitter without interrupting the flow measurement. NOTE: the transmitter calibration shall be disabled after finishing the transmitter calibration to recover the normal operation of the flow computer.

The option is selected from the list::

o no;

transmitters operate in normal way.

o yes;

transmitters are being calibrated. If the yes option is selected 4 new menu item appears allowing selection of the transmitters one by one, namely:

Flow meter

- o no;
 - flow meter operates in normal way.
- o yes;
 - flow meter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Pressure
 - o no;
 - pressure transmitter operates in normal way.
 - o yes;

.

- pressure transmitter is being calibrated.
- Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature 1
 - o no;
 - temperature 1 transmitter operates in normal way.
 - o yes;
 - temperature 1 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature 2

Route in the menu tree:

- o no;
 - temperature 2 transmitter operates in normal way.
- o yes;
 - temperature 2 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Ultrasonic meter path performance limit
 The path performance % is read from the ultrasonic meter for each path.
 Operator can set an alarm limit for path performance here. It the performance of any path is lower than alarm limit, an alarm raised.
 - It is selectable if in case of active alarm limit stream shall be switched to fault state or not.

Figure 9-112 Stream setup data page, fluid: crude oil, flow meter: liquid turbine

In this example it is assumed that the flow is measured by turbine meter with dual pulse train. The density is measured by two density transmitters at the header pipe.

The pressure of the fluid is measured at the flow meter and at the density meter.

The temperature of the fluid is measured at the flow meter and at the density meter.

The data fields on the data page are as follows:

- Fluid selected:
 - Not editable here, fixed to the fluid selected in the Fluid menu
- Units:
- See the available units for volume, mass and energy in Table 9-11.
- Flow meter:
 - Not editable here, fixed to the flow meter selected in the Flow meter menu
- Flow signal mode:
 - The mode selected from the list
 - 0 measured;
 - It is assumed that the flow signal is measured on pulse or analog input channel.
 - The channel number entered here.
 - 10 *n* Ch m;
 - *n* number of I/O board
 - m number of channel on the I/O board
 - modb. sign. (measured at Modbus channel);
 - It is assumed that the flow signal is received on Modbus channel. In this case new data entry field appear to enter the flow signal channel parameters.
 - Channel
 - n: *n*-number of Modbus channel;
 - keypad; 0

Keypad flow signal (volume flow rate at line conditions) can be entered here. It serves for testing the flow calculation only.

NOTE

If flow signal is set to keypad the flow rate will be displayed but no totalization will be done.

- Check signal mode:
- The mode selected from the list
 - none; 0
 - measured; 0

It is assumed that dual pulse train is received from the turbine meter to check the pulse integrity. The channel number of the check signal entered here.

- 10 *n* Ch m;
- n-number of I/O board
- m number of channel on the I/O board
- Signal ratio (Main to check signal ratio);
- Bad pulse threshold;

If the difference in the number of pulses received on the main and check pulse input channel higher then this limit then pulse input alarm is raised.

Good pulse threshold:

If in the pulse input alarm active state the number of pulses received after the pulse input alarm appeared higher then this limit then the pulse input alarm is cleared. However the alarm is logged in the alarm log file. If the good pulse threshold set to 0 then no automatic clearing of the pulse alarm is done.

Cut off (Low flow cut off);

Entered in % of the high range of the flow signal input channel.

- If the measured flow is below the low flow cut off limit then the flow is assumed to be zero.
- Eventing low flow cut off;
 - It is operator selectable if the low flow cut off will generate entry in the event log or not.
 - o yes;
 - o no;

0

- Pres. at flow meter (Pressure at flow meter mode);
 - The mode selected from the list (for duplicated pressure signals see 9.2.2.1.3.)
 - measured; 0
 - It is assumed that pressure is measured on analog input channel.
 - The channel number should be entered here.
 - IO nCh m
 - n number of I/O board
 - m number of channel on the I/O board
 - modb. sign. (measured at Modbus channel); It is assumed that pressure signal is received on Modbus channel.
 - The channel number should be entered here.
 - Channel
 - n *n*-number of Modbus channel;
 - keypad; 0
 - Keypad pressure can be entered here if pressure signal is not available.
- Temp. at flow meter (Temperature at flow meter mode);
- The mode selected from the list (for duplicated temperature signals see 9.2.2.1.3.)
 - measured; 0
 - It is assumed that temperature is measured on input channel.
 - The channel number should be entered here.
 - 10 *n* Ch m
 - n-number of I/O board
 - *m* number of channel on the I/O board
 - modb. sign. (measured at Modbus channel);
 - It is assumed that temperature signal is received on Modbus channel. The channel number should be entered here.
 - Channel n
 - *n* number of Modbus channel:
 - keypad; 0

Keypad temperature can be entered here if temperature signal is not available.

- Pres. at dens. meter (Pressure at density meter mode);
- The mode selected from the list (for duplicated pressure signals see 9.2.2.1.3.)
 - 0 measured;
 - It is assumed that pressure is measured on analog input channel.
 - The channel number should be entered here.
 - 10 *n* Ch m
 - n-number of I/O board
 - m number of channel on the I/O board
 - modb. sign. (measured at Modbus channel);
 - It is assumed that pressure signal is received on Modbus channel. The channel number should be entered here.
 - Channel n:
 - *n* number of Modbus channel:
 - kevpad;

0

- Keypad pressure can be entered here if pressure signal is not available.
- Temp at dens. meter (Temperature at density meter mode);
- The mode selected from the list (for duplicated temperature signals see 9.2.2.1.3.)
 - measured; 0
 - It is assumed that temperature is measured on input channel.
 - The channel number should be entered here.
 - 10 *n* Ch m
 - n-number of I/O board
 - m number of channel on the I/O board
 - modb. sign. (measured at Modbus channel); 0 It is assumed that temperature signal is received on Modbus channel. The channel number should be entered here.

- Channel n:
 - n number of Modbus channel;
- keypad; 0
 - Keypad temperature can be entered here if temperature signal is not available.
- No. of dens. meters (Number of density transmitters);
 - Selected from the list
 - 1 (one); 0
 - 0 2 (two);

The two densitometers are designated as A and B.

- Primary dens. meter (Primary density transmitter);
- The density primarily used in the flow calculation selected from the list
 - A; 0
 - 0 B;
 - average; 0
- Discrepancy;

The maximum discrepancy between the two densitometer readings entered. Required only if two densitometers selected

- 'A' dens. meter sign. ("A" density transmitter signal mode);
 - The mode selected from the list
 - measured; 0

-

- It is assumed that density is measured on input channel.
- The channel number should be entered here.
 - 10 *n* Ch m
 - n number of I/O board
 - *m* number of channel on the I/O board
- modb. sign. (measured at Modbus channel); 0
 - It is assumed that density signal is received on Modbus channel.

The channel number should be entered here.

- Channel
 - n: *n* – number of Modbus channel:
- keypad; 0

Keypad density can be entered here if density signal is not available.Dens.met."A" body T ("A" density transmitter body temperature):

- The mode selected from the list
 - o measured;
 - It is assumed that temperature is measured on input channel.

The channel number should be entered here.

- 10 nCh m
 - n number of I/O board
 - *m* number of channel on the I/O board
- modb. sign. (measured at Modbus channel); 0
 - It is assumed that temperature signal is received on Modbus channel.

The channel number should be entered here.

- Channel _
 - n; *n* – number of Modbus channel;
- keypad;

0

- Keypad temperature can be entered here if temperature signal is not available.
- 'B' dens. meter sign. ("B" density transmitter signal mode);
- The mode selected from the list
 - 0 measured;
 - It is assumed that density is measured on input channel.

The channel number should be entered here.

- IO nCh m
 - n number of I/O board
 - m number of channel on the I/O board
- modb. sign. (measured at Modbus channel);
 - It is assumed that density signal is received on Modbus channel.

The channel number should be entered here.

- Channel
 - n: *n* – number of Modbus channel;
- keypad;

0

- Keypad density can be entered here if density signal is not available.
- Dens.met.'B' body T ('B' density transmitter body temperature);

The mode selected from the list

- o measured;
 - It is assumed that temperature is measured on input channel.

The channel number should be entered here.

- IO *n* Ch *m*
 - n-number of I/O board
 - m number of channel on the I/O board
- o modb. sign. (measured at Modbus channel);
 - It is assumed that temperature signal is received on Modbus channel.
 - The channel number should be entered here.
 - Channel *n*;
 - *n* number of Modbus channel;
- o keypad;

Keypad temperature can be entered here if temperature signal is not available.

• Stream disabling;

It is possible to disable the operation of the stream depending on different parameters. The option is selected from the list:

- o no;
 - Stream never disabled.
- o input signal;

Any I/O channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none

The channel number and the limit causing the stream disabled should be entered here.

- IO *n* Ch *m*;
 - n number of I/O board
 - m number of channel on the I/O board
- Limit to disable;
 - Lower limit
 - lo (low alarm limit of the I/O channel);
 - lolo (low-low alarm limit of the I/O channel);
 - lsc (low scale of the I/O channel);
 - (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the I/O channel);
- hihi (high-high alarm limit of the I/O channel);
- hsc (high scale of the I/O channel);
 - (no upper limit will disable the stream);
- o modbus signal;

Any Modbus channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The channel number and the limit causing the stream disabled should be entered here.

- Channel n;
- *n* number of Modbus channel;
- Limit to disable;
- Lower limit

_

- 10 (low alarm limit of the Modbus channel);
- lolo (low-low alarm limit of the Modbus channel);
- lsc (low scale of the Modbus channel);
- (no lower limit will disable the stream);
- Upper limit
- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- (no upper limit will disable the stream);
- o from stream;
 - Any stream can be selected.

One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

- The upper limit is selected from hsc, hi, hihi or none.
- The stream number and the limit causing the stream disabled should be entered here.

Stream n: n – serial number of the stream from 1 to 12; Limit to disable: - Lower limit (low alarm limit of the Stream *n*); - lo - lolo (low-low alarm limit of the Stream *n*); - lsc (low scale of the Stream *n*); - no lower limit will disable the stream); - Upper limit (high alarm limit of the Stream *n*): - hi - hihi (high-high alarm limit of the Stream n; - hsc (high scale of the Stream *n*); – (no upper limit will disable the stream);

The values of the upper and lower limits are set in the Limits menu of the Stream n being the stream disabling the current stream. The type of flow rate (volume at line or at base conditions, mass or energy flow rate) is selected also in the Limits menu of the Stream n. See 9.2.2.1.5.

Batch;

Batch measurement is enabled or disabled here.

The option is selected from the list:

o no;

No batch measurement performed.

o yes;

Batch measurement is enabled. New data entry lines appear where the parameters of the batch measurement shall be enter.

Batch start/stop

The batch start/stop method is selected here from the list of options:

- from communication interface;

The batch measurement starts and stops by writing certain Modbus registers. The mapping of the start/stop Modbus registers and also the registers where the measured data can be read from see in 10.5.2.

- start key/required quantity;

The batch measurement starts with pulse (pulse length min. 1 s) applied to the appropriate digital input. The batch measurements stops when the required quantity (mass or volume) passed the meter run. The batch measurement can be stopped in case of emergency applying pulse (pulse length min. 1 s) to the appropriate digital input.

In case of this start/stop method, new data entry lines appear as follows:

Required quantity

Selected from the list:

- uncorr. volume (required quantity is entered in volume units at line conditions);
- mass (required quantity is entered in mass units);
- Batch quantity
- Numeric entry field to enter the required batch quantity.
- Batch start input (digital input channel to start batch measurement)
- IO n Ch m

n – number of I/O board

m – number of channel on the I/O board

Batch stop input (digital input channel to stop batch measurement in case of emergency)
 IO n Ch m

n – number of I/O board

m-number of channel on the I/O board

- Batch control input (digital output channel set to active state during the batch measurement)
 - IO *n* Ch *m*

n-number of I/O board

m – number of channel on the I/O board

- daily batch measurement;

The batch measurement starts at the defined hour of day and lasts 24 hours (one day). After one day finished the batch measurement for the next day starts automatically. Batch report generated after each day. By this setting second set of daily counters can be defined, which are independent from the standard daily counters and the start hour of this daily batch is also independent from the general starting hour of the day.

In case of this start/stop method, new data entry lines appear as follows:

Start hour of daily batch

Numeric entry field to enter the start hour of the daily batch measurement. Valid entries are from 0 to 23.

Batch type

The type of batch measurement is selected here from the list of options:

- Tank loading/unloading;
 - Conventional tank loading batch measurement (see 9.1.7.1).
- Pipeline product interface;

Different kind of fluids flowing in the same pipeline each after other measured as batches (see 9.1.7.2).

Available only if batch start/stop method is "from communication interface".

In case to Pipeline product interface batch type new data entry line appear:

Product info

Entering into this entry line new data entry display appears where up to 16 different product type and the corresponding density at base conditions shall be entered. See also in 9.2.2.1.1.5. Liquids.

The name of the stream entered in 9.2.2.1. will be displayed on the batch report as station name. To display the results of the batch measurements, see 9.1.7.

Meter serial test

Flow meter serial test measurement can be enabled or disabled here.

The option is selected from the list:

- o disabled;
 - No flow meter serial test measurement performed.
- o meter serial test;

Flow meter serial test measurement is enabled.

Serial test can be enabled on Stream 1 only.

Warning message appears:

Proceeding will reset all totals and parameters of stream 8. Proceed?

Selecting yes two new lines appear.

- Shadow stream 8
- In the non-custody transfer flow computer, the measured values and totals are displayed in stream 8.
- Stream
 - The option is selected from the list:
 - custody transfer stream (slave);
 - The stream being set up will perform the custody transfer measurement during the serial test. It will operate in normal way. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the slave device.
 - non custody transfer stream (master);
 The stream being set up will perform non custody transfer measurement during the serial test. It will display and totalize the flow in stream 8 instead of the stream being configured for the particular meter run. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the master device.
- o flow computer calibration;

The flow computer calibration is a special subset of the meter serial test.

- Selecting this option:
- the stream 8 will be the shadow stream;
- Uniflow-200 will be the Master device in the calibration.

See details of the meter serial test measurements and the flow computer calibration in 9.1.8.

Transmitter calibration

Calibration of the transmitters can be enabled or disabled here. When calibration is enabled for a certain transmitter keypad value shall be entered for the parameter being measured by that transmitter. In this case the flow calculation will be performed with the keypad value of the parameter. The measured value of the input signal is still displayed in the Flow / Plant I/O / IO Board x menu allowing the calibration of the transmitter without interrupting the flow measurement. NOTE: the transmitter calibration shall be disabled after finishing the transmitter calibration to recover the normal operation of the flow computer.

The option is selected from the list:

- o no;
 - transmitters operate in normal way.
- o yes;

transmitters are being calibrated. If the yes option is selected 4 new menu item appears allowing selection of the transmitters one by one, namely:

- Flow meter
 - o no;
 - flow meter operates in normal way.
 - o yes;
 - flow meter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Pressure
 - o no;
 - pressure transmitter operates in normal way.
 - o yes;
 - pressure transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature 1
 - o no;
 - temperature 1 transmitter operates in normal way.
 - o yes;
 - temperature 1 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature 2
 - o no;
 - temperature 2 transmitter operates in normal way.
 - o yes;

•

- temperature 2 transmitter is being calibrated.
- Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.

9.2.2.1.3.5 Stream setup example – fluid: crude oil, flow meter: mass flow meter

Route in the menu tree:			
Parameters Streams	Physical stream	Stream 1. Stream	m set up

Figure 9-113 Stream setup data page, fluid: crude oil, flow meter: mass flow meter

In this example it is assumed that the flow is measured by mass flow meter. The density is measured also by the mass flow meter.

The pressure and the temperature of the fluid are measured at the flow meter.

The data fields on the data page are as follows:

- Fluid selected;
 - Not editable here, fixed to the fluid selected in the Fluid menu
- Units;
 - See the available units for volume, mass and energy in Table 9-11.
- Flow meter;
 - Not editable here, fixed to the flow meter selected in the Flow meter menu;
- Flow signal mode;

The mode selected from the list

o measured;

It is assumed that the flow signal is measured on pulse or analog input channel.

The channel number entered here.

IO n Ch m;

n- number of I/O board

m – number of channel on the I/O board

o modb. sign. (measured at Modbus channel);

It is assumed that the flow signal is received on Modbus channel. In this case new data entry field appear to enter the flow signal channel parameters.

Channel *n*;

n – number of Modbus channel;

o keypad;

Keypad flow signal (mass flow rate) can be entered here. It serves for testing the flow calculation only. NOTE

If flow signal is set to keypad the flow rate will be displayed but no totalization will be done.

Cut off (Low flow cut off);

Entered in % of the high range of the flow signal input channel.

If the measured flow is below the low flow cut off limit then the flow is assumed to be zero.

• Eventing low flow cut off;

It is operator selectable if the low flow cut off will generate entry in the event log or not.

- o yes;
- o no;

0

Pres. at flow meter (Pressure at flow meter mode);

The mode selected from the list (for duplicated pressure signals see 9.2.2.1.3.)

o measured;

It is assumed that pressure is measured on analog input channel.

- The channel number should be entered here.
 - IO n Ch m
 - n- number of I/O board
 - m number of channel on the I/O board
 - modb. sign. (measured at Modbus channel);

It is assumed that pressure signal is received on Modbus channel.

- The channel number should be entered here.
 - Channel n;
 - *n* number of Modbus channel;

o keypad;

Keypad pressure can be entered here if pressure signal is not available.

- Temp. at flow meter (Temperature at flow meter mode);
- The mode selected from the list (for duplicated temperature signals see 9.2.2.1.3.)
 - o measured;

It is assumed that temperature is measured on input channel.

The channel number should be entered here.

- IO n Ch m
- n-number of I/O board
- m number of channel on the I/O board
- o modb. sign. (measured at Modbus channel);

It is assumed that temperature signal is received on Modbus channel.

The channel number should be entered here.

- Channel n;
- *n* number of Modbus channel;
- o keypad;

Keypad temperature can be entered here if temperature signal is not available.

Density signal;

The mode selected from the list

o measured;

It is assumed that density is measured on input channel.

- The channel number should be entered here.
 - IO n Ch m
 - *n* number of I/O board
 - m number of channel on the I/O board
 - modb. sign. (measured at Modbus channel);

It is assumed that density signal is received on Modbus channel.

The channel number should be entered here.

Channel *n*;

n – number of Modbus channel;

o keypad;

Keypad density can be entered here if density signal is not available.

Stream disabling;

0

It is possible to disable the operation of the stream depending on different parameters.

The option is selected from the list:

o no;

Stream never disabled.

o input signal;

Any I/O channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none

The channel number and the limit causing the stream disabled should be entered here.

- IO *n* Ch *m*;
 - n-number of I/O board

m – number of channel on the I/O board

- Limit to disable;
- Lower limit
 - 10 (low alarm limit of the I/O channel);
 - lolo (low-low alarm limit of the I/O channel);
 - lsc (low scale of the I/O channel);
 - (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the I/O channel);
- hihi (high-high alarm limit of the I/O channel);
- hsc (high scale of the I/O channel);
- - (no upper limit will disable the stream);
- o modbus signal;

Any Modbus channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The channel number and the limit causing the stream disabled should be entered here.

- Channel n;
 - *n* number of Modbus channel;
 - Limit to disable;
 - Lower limit
 - 10 (low alarm limit of the Modbus channel);
 - lolo (low-low alarm limit of the Modbus channel);
 - lsc (low scale of the Modbus channel);
 - (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- - (no upper limit will disable the stream);
- o from stream;

Any stream can be selected.

One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The stream number and the limit causing the stream disabled should be entered here.

- Stream *n*,

n – serial number of the stream from 1 to 12;

Limit to disable;

- Lower limit	
	 lo (low alarm limit of the Stream n); lolo (low-low alarm limit of the Stream n); lsc (low scale of the Stream n); no lower limit will disable the stream);
- Upper limit	
	 hi (high alarm limit of the Stream n);
	 hihi (high-high alarm limit of the Stream n;
	 hsc (high scale of the Stream n);
	 – (no upper limit will disable the stream);
	The values of the upper and lower limits are set in the Limits menu of t

The values of the upper and lower limits are set in the Limits menu of the Stream n being the stream disabling the current stream. The type of flow rate (volume at line or at base conditions, mass or energy flow rate) is selected also in the Limits menu of the Stream n. See 9.2.2.1.5.

Batch;

Batch measurement is enabled or disabled here.

The option is selected from the list:

- o no;
 - No batch measurement performed.
- o yes;

Batch measurement is enabled. New data entry lines appear where the parameters of the batch measurement shall be entered.

Batch start/stop

The batch start/stop method is selected here from the list of options:

- from communication interface;

The batch measurement starts and stops by writing certain Modbus registers. The mapping of the start/stop Modbus registers and also the registers where the measured data can be read from see in 10.5.2.

- start key/required quantity;

The batch measurement starts with pulse (pulse length min. 1 s) applied to the appropriate digital input. The batch measurements stops when the required quantity (mass or volume) passed the meter run. The batch measurement can be stopped in case of emergency applying pulse (pulse length min. 1 s) to the appropriate digital input.

In case of this start/stop method, new data entry lines appear as follows:

Required quantity

Selected from the list:

- uncorr. volume (required quantity is entered in volume units at line conditions);
- mass (required quantity is entered in mass units);
- Batch quantity

Numeric entry field to enter the required batch quantity.

- Batch start input (digital input channel to start batch measurement)
- IO *n* Ch *m*

n – number of I/O board

- m number of channel on the I/O board
- Batch stop input (digital input channel to stop batch measurement in case of emergency)
 IO n Ch m
- n number of I/O board

m – number of channel on the I/O board

- Batch control input (digital output channel set to active state during the batch measurement)
 - IO n Ch m

n-number of I/O board

m – number of channel on the I/O board

- daily batch measurement;

The batch measurement starts at the defined hour of day and lasts 24 hours (one day). After one day finished the batch measurement for the next day starts automatically. Batch report generated after each day. By this setting second set of daily counters can be defined, which are independent from the standard daily counters and the start hour of this daily batch is also independent from the general starting hour of the day.

In case of this start/stop method, new data entry lines appear as follows:

• Start hour of daily batch

Numeric entry field to enter the start hour of the daily batch measurement. Valid entries are from 0 to 23.

Batch type

The type of batch measurement is selected here from the list of options:

- Tank loading/unloading;
 - Conventional tank loading batch measurement (see 9.1.7.1).
- · Pipeline product interface;

Different kind of fluids flowing in the same pipeline each after other measured as batches (see 9.1.7.2).

Available only if batch start/stop method is "from communication interface".

In case to Pipeline product interface batch type new data entry line appear:

Product info

Entering into this entry line new data entry display appears where up to 16 different product type and the corresponding density at base conditions shall be entered. See also in 9.2.2.1.1.5. Liquids.

The name of the stream entered in 9.2.2.1. will be displayed on the batch report as station name. To display the results of the batch measurements see 9.1.7.

Meter serial test

0

Flow meter serial test measurement can be enabled or disabled here. The option is selected from the list::

o disabled;

•

No flow meter serial test measurement performed.

meter serial test;

Flow meter serial test measurement is enabled.

Serial test can be enabled on Stream 1 only.

Warning message appears:

Proceeding will reset all totals and parameters of stream 8. Proceed?

- Selecting yes two new lines appear.
 - Shadow stream 8
 - In the non custody transfer flow computer the measured values and totals are displayed in stream 8. Stream
 - The option is selected from the list:
 - custody transfer stream (slave);
 - The stream being set up will perform the custody transfer measurement during the serial test. It will operate in normal way. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the slave device.
 - non custody transfer stream (master);

The stream being set up will perform non custody transfer measurement during the serial test. It will display and totalize the flow in stream 8 instead of the stream being configured for the particular meter run. In the data exchange between the two flow computers taking part in the flow meter serial test this flow computer will be the master device.

o flow computer calibration;

The flow computer calibration is a special subset of the meter serial test. Selecting this option:

- the stream 8 will be the shadow stream;
- Uniflow-200 will be the Master device in the calibration.

See details of the meter serial test measurements and the flow computer calibration in 9.1.8.

Transmitter calibration

Calibration of the transmitters can be enabled or disabled here. When calibration is enabled for a certain transmitter keypad value shall be entered for the parameter being measured by that transmitter. In this case the flow calculation will be performed with the keypad value of the parameter. The measured value of the input signal is still displayed in the Flow / Plant I/O / IO Board x menu allowing the calibration of the transmitter without interrupting the flow measurement. NOTE: the transmitter calibration shall be disabled after finishing the transmitter calibration to recover the normal operation of the flow computer.

The option is selected from the list:

o no;

0

- transmitters operate in normal way.
- yes;

transmitters are being calibrated. If the yes option is selected 4 new menu item appears allowing selection of the transmitters one by one, namely:

- Flow meter
 - o no;
 - flow meter operates in normal way.
 - o yes;

.

- flow meter is being calibrated.
- Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Pressure
 - o no;
 - pressure transmitter operates in normal way.
 - o yes;
 - pressure transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature 1
 - o no;
 - temperature 1 transmitter operates in normal way.
 - o yes;
 - temperature 1 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.
- Temperature 2
 - o no;
 - temperature 2 transmitter operates in normal way.
 - o yes;
 - temperature 2 transmitter is being calibrated.
 - Keypad value
 - keypad value to be used in the calculation during the transmitter calibration shall be entered.

9.2.2.1.3.6 Stream setup example – fluid: electric power, flow meter: electrical power meter

Route in the menu tree:			
Parameters Streams	Physical stream	Stream 1.	Stream set up
	02.Str. STR2 Stream setup Fluid selected	electric power lectr.power meter measured 3 IO 4 ch. 0.1 % no Total Flowrate MVAh MVA no no	

Figure 9-114 Stream setup data page, fluid: electric power, flow meter: electrical power meter

In this example it is assumed that electrical power measurement is required. The flow signal is proportional to the electrical power. In fact, no flow calculation but only the totalization of the flow signal is required.

The data fields on the data page are as follows:

• Fluid selected; Not editable here, fixed to the fluid selected in the Fluid menu

Save

- Flow meter;
 - Not editable here, fixed to the flow meter selected in the Flow meter menu
- Units (Total Flowrate);
 - Not editable here. The unit of measurement for the Total and Flow rate is taken from the flow signal • MVAh – MVA; (in the example)
- Flow signal mode;
 - The mode selected from the list

-

o measured;

It is assumed that the flow signal is measured on pulse or analogue input channel.

The channel number entered here.

- IO *n*Ch *m*;
- n-number of I/O board
- *m* number of channel on the I/O board
- o modb. sign. (measured at Modbus channel);

It is assumed that the flow signal is received on Modbus channel. In this case new data entry field appear to enter the flow signal channel parameters.

- Channel *n*;
- n number of Modbus channel;
- o keypad;

Keypad flow signal can be entered here. It serves for testing the flow calculation only. NOTE

If flow signal is set to keypad the flow rate will be displayed but no totalization will be done.

• Cut off (Low flow cut off);

Entered in % of the high range of the flow signal input channel.

If the measured flow is below the low flow cut off limit then the flow is assumed to be zero.

Eventing low flow cut off;

It is operator selectable if the low flow cut off will generate entry in the event log or not.

- o yes;
 - o no;
- LF pulse counter;

Not applicable for electric power meter, leave it to "no"

• Stream disabling;

It is possible to disable the operation of the stream depending on different parameters. The option is selected from the list:

o no;

Stream never disabled.

o input signal;

Any I/O channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none

The channel number and the limit causing the stream disabled should be entered here.

- IO *n* Ch *m*;
 - n-number of I/O board

m – number of channel on the I/O board

- Limit to disable;
 - Lower limit
 - lo (low alarm limit of the I/O channel);
 - lolo (low-low alarm limit of the I/O channel);
 - lsc (low scale of the I/O channel);
 - – (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the I/O channel);
- hihi (high-high alarm limit of the I/O channel);
- hsc (high scale of the I/O channel);
- (no upper limit will disable the stream);
- o modbus signal;

Any Modbus channel signal can be selected. One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The channel number and the limit causing the stream disabled should be entered here.

- Channel n;

n – number of Modbus channel;

Limit to disable;

- Lower limit
 - lo (low alarm limit of the Modbus channel);
- lolo (low-low alarm limit of the Modbus channel);
- lsc (low scale of the Modbus channel);
- – (no lower limit will disable the stream);

Upper limit

- hi (high alarm limit of the Modbus channel);
- hihi (high-high alarm limit of the Modbus channel);
- hsc (high scale of the Modbus channel);
- - (no upper limit will disable the stream);
- o from stream;
 - Any stream can be selected.

One lower limit and one upper limit can be selected to disable the stream. The lower limit is selected from lsc, lo, lolo or none.

The upper limit is selected from hsc, hi, hihi or none.

The stream number and the limit causing the stream disabled should be entered here.

- Stream n;

n – serial number of the stream from 1 to 12;

Limit to disable;

- Lower limit

-	lo	(low alarm l	limit of the	Stream n);
---	----	--------------	--------------	------------

- lolo (low-low alarm limit of the Stream n);
- lsc (low scale of the Stream n);
- no lower limit will disable the stream);

- Upper limit

- hi (high alarm limit of the Stream *n*);
- hihi (high-high alarm limit of the Stream *n*;
- hsc (high scale of the Stream n);
 - - (no upper limit will disable the stream);

The values of the upper and lower limits are set in the Limits menu of the Stream n being the stream disabling the current stream. The type of flow rate (volume at line or at base conditions, mass or energy flow rate) is selected also in the Limits menu of the Stream n. See 9.2.2.1.5.

9.2.2.1.4 Premium limits

UNIFLOW-200 is prepared to totalize flow in separate counters if the flow rate higher, then a preset limit. The limits for the flow rates are set on this data page.

The premium limit mode, i.e. if he premium flow is calculated on the instantaneous flow rate or on the hourly totals is set in the Premium limit mode setup menu (see section 9.2.2.3)

Function of the F keys on the Premium limits data pages

select the next field for editing

select the previous field for editing

Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

ENERGY flowrate	0	GJ∕h
Save Change		

Figure 9-115 Premium limits data page

The data fields on the data page are as follows:

- Premium limit mode;
 - Not editable here, fixed to the mode selected in the Premium limit mode menu
- CVOL flowrate (volume flow rate at base conditions);
- UVOL flowrate (volume flow rate at line conditions);
- MASS flowrate (mass flow rate);
- ENGY flowrate (energy flow rate);

9.2.2.1.5 Limits

The low-low, lo, high. high-high limits can be set for the stream flow rate.

Function of the F keys on the Limits data pages

select the next field for editing

f select the previous field for editing

Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

Route in the menu tree:

Parameters	Streams	Physical stream	Stream 1.	Limits
		01.Str. ASZK1		
		Str. limits		
		Flow selected	CVOL flowra	-
		LO_limit		m³/h
		HI_limit		m³/h
		LOLO_limit		m³/h
		HIHI_limit	0	m³/h
		Event at	lo,hi,lolo,hihi	
		Log	n n n n	
		Eventing	nn n n	
		Menu		T

Figure 9-116 Limits data page

The data fields on the data page are as follows:

- Flow selected;
 - The type flow rate the limit check is applied to is selected here from the list
 - CVOL flowrate (volume flow rate at base conditions);
 - O UVOL flowrate (volume flow rate at line conditions);
 - o MASS flowrate (mass flow rate);
 - o ENGY flowrate (energy flow rate);
 - o CO2 mass (CO2 emission flow rate);
- LO limit;

- HI limit;
- LOLO limit;
- HIHI limit;
- Event at

It can be selected here that which of the events shall initiate an entry in the event log file of the flow computer and which of the events shall generate event in the alarm system. The options are:

- \circ 1 \circ (lo limit);
- o hi (hi limit);
- o lolo (lolo limit);
- o hihi (hihi limit);
- Log
- Eventing

Selecting y (yes) in the "Log" line causes an entry shall be generated in the log file.

Selecting n(no) in the Log line causes no entry is generated in the log file. In this case no y(yes) can be selected in the "Eventing" line.

If in the "Log" line y(yes) is selected, then in the "Eventing" line y(yes) or n(no) can be selected, i.e. the operator can decide if the event generates event in the alarm system or not.

9.2.2.2 Virtual stream setup

Virtual streams are designed to perform calculations on the flows determined in the physical streams. Such calculations include for example:

- summing flows of several metering streams to create station totals;
- calculate difference of two flows;
- calculate net efficiency of a boiler;
- calculate pure alcohol flow from the flow of alcohol-water mixture;

First the virtual stream should be selected on the data page shown below.

Stream name can also be entered here.

Route in the menu tree:

Parameters Streams Virtual streams

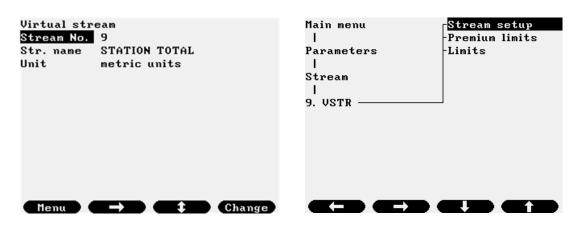

Figure 9-117 Virtual stream selection data page

The system of units shall be selected on this page. Available selections are:

- o metric units;
- o imperial units;

Note:

If the "imperial units" is selected then the unit in all the physical streams flow rate of which processed in this virtual stream shall also be set as "imperial units". See 9.2.2.1.

If the "imperial units" is selected then the unit of volume, mass and energy are set automatically as follows:

- o volume/volume flow rate MCF MCF/h;
- o mass/mass flow rate lb lb/h;
- o energy/energy flow rate MMBTU /h;

and can not be altered.

After selecting the stream to be edited the virtual stream setup data page opens.

9.2.2.2.1 Virtual stream setup

Route in the menu tree:

Figure 9-118 Virtual stream setup data page

The data fields on the data page are as follows:

- Calc. variable (Calculated variable);
 - Selected from the list
 - o flow rate;

The virtual stream calculates the flow rates (volume, mass or energy flow rate, depending on the selection in the Parameter selection data field below) according to the equation defined below. The unit of measurement can be selected for the different flow rates.

NOTE

The volume is assumed to be the volume at base conditions.

The selected unit for volume must be the same unit as volume unit in the physical streams processed in virtual stream.

- volume unit (Total Flowrate);
 - m3 m3/h;;
 - 1 1/h;
- mass unit (Total Flowrate);
 - kg kg/h;
 - t t/h
- energy unit (Total Flowrate);
 - GJ GJ/h;
 - MJ MJ/h;
 - kWh kWh/h;
 - MWh MWh/h;
 - kVAh kVA;
 - MVAh MVA;
- Parameter selection;

The parameter to be processed according to the equation defined below should be selected here from the list. One, two, three or all four parameters can be selected.

- volume;
- mass;
- energy;
- CO2 mass;
- o other param. (other parameter);

If the calculated parameter is not a flow rate but some other parameter then the name of the calculated parameter and its unit can be entered in the data fields below.

- Variable name;
 - Unit selection;
 - %;
 - other;
- Input param. selection (Input parameter selection);

The parameter to be processed according to the equation defined below should be selected here from the list.

- volume;
- mass;
- energy;
- Operation (Operation to be performed);

The operation should be selected from the list.

- integration;
 - Integration (totalization) can be performed if flow rate is selected as the calculated variable.
- averaging;
 - If the calculated variable is not a flow type parameter (for example concentration) then averaging will be performed on the parameter since the integration is not interpreted on the non flow type parameter.
- Equation setup;

The equation describing the calculation to be performed should be entered.

Example 1

Summarize the flow rates from stream 1, 2 and 3 Virtual stream M9 will calculate the sum of flow rates and will totalize the sums into the stream 9 counters. M9 = M1+M2+M3

Example 2

Calculate the pure alcohol quantity from the flow and from the alcohol concentration measured on stream 1. The pure alcohol in calculated in "100 liters per degree of alcohol" abbreviated as "hldeg". M9=M1*MV1/100

Rules to be followed in the equation setup:

- valid operations: + (summation), (subtraction), * (multiplication), / (division)
- equation must fit into one line
- first the multiplication and division performed then the summation and subtraction
- operations equal in rank are performed from left to right
- equation must starts with number or identifier, it must not be started with operation sign
- virtual stream with lower serial number can only be referenced

Valid identifiers in the equation setup:

- M1 ... M11 flow rate calculated in streams 1 to 11. Depending on the Parameter selection above it can be volume, mass and energy flow rate.
- MV1 ... MV8 concentration (measured or calculated) in streams 1 ... 8 in % (volume)
- MM1 ... MM8 concentration (measured or calculated) in streams 1 ... 8 in % (mass)

9.2.2.2.2 Virtual stream Premium limits

UNIFLOW-200 is prepared to totalize flow in separate counters if the flow rate higher, then a preset limit. The limits for the flow rates are set on this data page.

The premium limit mode, i.e. if he premium flow is calculated on the instantaneous flow rate or on the hourly totals is set in the Premium limit setup menu (see section 9.2.2.3)

Route in the menu tree:						
Parameters	Streams	Virtual streams	Stream 9.	Premium limits

09.Vstr. STATION	TOT	'AL			
Vstr. limits					
Flow selected		C	JOL	flowr	ate
LO_limit				0	m³/h
HI_limit				0	m³/h
LOLO_limit				0	m³/h
HIHI_limit				0	m³/h
Event at	lo	,hi,	lolo	,hihi	
Log	n	n	n	n	
Eventing	n	n	n	n	
		_	_		
Menu			t.		

The data fields on the data page are as follows:

- Flow selected; •
 - The type flow rate the limit check is applied to is selected here from the list
 - CVOL flowrate (volume flow rate at base conditions);
 - o MASS flowrate (mass flow rate);

- o ENGY flowrate (energy flow rate);
- o CO2 mass (CO2 emission flow rate);

- LO limit;
- HI limit;
- LOLO limit;
- HIHI limit;
- Event at

It can be selected here that which of the events shall initiate an entry in the event log file of the flow computer and which of the events shall generate event in the alarm system. The options are:

- o lo (lo limit);
- o hi (hi limit);
- o lolo (lolo limit);
- o hihi (hihi limit);
- Log
- Eventing

Selecting y(yes) in the "Log" line causes an entry shall be generated in the log file.

Selecting n(no) in the Log line causes no entry is generated in the log file. In this case no y(yes) can be selected in the "Eventing" line.

If in the "Log" line y(yes) is selected, then in the "Eventing" line y(yes) or n(no) can be selected, i.e. the operator can decide if the event generates event in the alarm system or not.

9.2.2.3 Premium mode setup

Route in the menu tree:

Parameters Streams Premium mode setup

Function of the F keys on the premium mode setup data pages

- select the next field for editing
- f select the previous field for editing
- Change modify the selected data field
- **OK** Confirm the selection
- Save save the selected/entered data and returns to the parent menu.

Figure 9-121 Premium mode setup data page

The mode for premium flow calculation should be setup.

The premium mode selected here is valid for all streams. No separate mode for separate streams can be selected.

The data fields on the data page are as follows:

- Premium limit mode;
 - Selected from the list
 - o hourly total;

Premium limits are evaluated at the end of each hour. If the hourly quantity (volume, mass and energy) exceeds the premium limit then the quantity above the limit is added to separate premium total counter. The whole total (including the premium part) is totalized in the cumulative and periodic totals as well.

- o flow rate;
 - hysteresis;
 - timeout

The instantaneous flow rate (volume, mass and energy) is permanently compared to the premium limit. If the flow rate exceeds the premium limit + hysteresis and it exceeds longer then the timeout time, then the flow rate exceeding the premium limit is totalized into separate premium counter. The totalization into the premium counters stops when the flow rate decreases below the premium limit. Exceeding the premium limit generates an entry in the event log.

The whole total (including the premium part) is totalized in the cumulative and periodic totals as well.

9.2.2.4 Fault mode setup

Route in the menu tree:

	Save	Cha	nge		Menu 🔵

Figure 9-122 Fault mode setup data page

The mode for fault total calculation should be setup.

The fault mode selected here is valid for all streams. No separate mode for separate streams can be selected.

The data fields on the data page are as follows:

- Fault total mode:
 - Selected from the list
 - normal and fault totals; 0
 - In fault condition the totals are totalized in normal and fault totals.
 - fault totals only; 0
 - In fault condition the totals are totalized in fault totals only.

The stream considered to be in fault condition if for example:

- input signal fails and the default value of the signal is used in the calculation; -
- the difference in the two pulse trains in case of turbine meter exceeds certain limit;
- the beta ratio for the orifice meter is outside the limit described in the standard.

Virtual stream is considered to be in fault condition if any of the streams the data used in the virtual stream calculation from is in fault condition.

See the full list of fault conditions in section 9.3.

9.2.2.5 **Barometric pressure**

Route in the menu tree: Parameters Streams barometric pressure

Function of the F keys on the barometric pressure data pages

- select the next field for editing π
- 企 select the previous field for editing

Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

Streams		
Barometric press. keypad value	keypad 1 bay	n
xeypau value	I ba	L-
Save Change		_

In volume at base conditions flow calculation (e.g. in PTZ calculation) the absolute pressure is required. If the transmitter measuring the pressure is gauge pressure transmitter, then UNIFLOW-200 determines the absolute pressure as sum of the measured gauge pressure plus the barometric pressure. It is assumed that the barometric pressure is common for all streams. The mode for the barometric pressure should be setup here.

The mode selected from the list o measured; It is assumed that barometric pressure is measured on analog input channel. The channel number should be entered here. IO nCh m n – number of I/O board m – number of channel on the I/O board o modb. sign. (measured at Modbus channel); It is assumed that barometric pressure signal is received on Modbus channel. The channel number should be entered here. Channel n; *n*-number of Modbus channel; o keypad; Keypad barometric pressure can be entered here if barometric pressure signal is not available.

9.2.2.6 Averaging

Route in the menu tree:

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu

Menu returns to the parent menu

Streams Averaging		weighted	average
Save	Change	•	Menu

Figure 9-124 Averaging setup data page

The data fields on the data page are as follows:

- Averaging method;
 - o arithmetic average;

o flow weighted average;

In case of arithmetic averaging the value of the parameter to be averaged measured in each calculation cycle will be averaged. In case of flow weighted averaging the value of the parameter to be averaged measured in each calculation cycle will be weighted with the volume at base condition (CVOL) measured in that cycle before the average is calculated. NOTE

The flow weighted average of a parameter is zero in no flow condition even if the parameter itself is different from zero. Averages are calculated for each time period defined in the flow computer, i.e. hourly, shift, daily, multiday and monthly averages are calculated.

9.2.2.7 Totals format

Route in the menu tree:

Figure 9-136 User report editing data page for User reports 3 to 10

User report 3 to User report 10 are daily billing reports for streams. Each of the 8 reports can be freely assigned to any stream. See sample of reports in Annex A.

The reports are consist of 5 sections:

- header section;
- totals section;
- daily data section;
- hourly data section;
- footer section.

In the header section general data of the metering stream are indicated.

In the totals section totals are indicated in four columns. The type of totals can be selected from the list as follows:

- o UVOL; (volume at line conditions)
- CVOL; (volume at base conditions)
- o Mass; (mass)
- o Energy; (energy)
- o CO2 mass; (CO2 emission mass)
- o Fault UVOL; (volume at line conditions at fault condition)
- o Fault CVOL; (volume at base conditions at fault condition)
- o Fault Mass; (mass at fault condition)

- o Fault Energy; (energy at fault condition)
- o Fault CO2 mass; (CO2 emission mass at fault condition)
- o Premium UVOL; (premium volume at line conditions)
- o Premium CVOL; (premium volume at base conditions)
- o Premium Mass; (premium mass)
- o Premium Energy; (premium energy)
- o Premium CO2 mass; (premium CO2 emission mass)

The report will indicate the total for the previous day, for the current day and the cumulative total, for the type of total selected.

In the daily data section totals and/or averages are indicated in 7 columns. The type of totals/averages can be selected from the list as follows:

- $\circ~{\tt UVOL}$; (volume at line conditions)
- o CVOL; (volume at base conditions)
- o Mass; (mass)

o Energy; (energy)

- o CO2 mass; (CO2 emission mass)
- o Fault UVOL; (volume at line conditions at fault condition)
- o Fault CVOL; (volume at base conditions at fault condition)
- o Fault Mass; (mass at fault condition)
- o Fault Energy; (energy at fault condition)
- o Fault CO2 mass; (CO2 emission mass at fault condition)
- o Premium UVOL; (premium volume at line conditions)
- o Premium CVOL; (premium volume at base conditions)
- o Premium Mass; (premium mass)
- o Premium Energy; (premium energy)
- o Premium CO2 mass; (premium CO2 emission mass)
- o Temp average; (average temperature)
- o Press average; (average pressure)
- o dP average; (average differential pressure)
- o K(Zl/Zb) average; (average compressibility ratio)
- o Spec.carb.average; (average specific carbon content)
- o Inf.cal.val.average; (average inferior calorific value)
- o Sup.cal.val.average; (average superior calorific value)
- o Line dens average; (average line density)
- o Base dens average; (average base density)
- o Rel.dens.average; (average relative density)
- o Flow time; (flow duration)
- o GC updates; (number of times the gas composition has been updated)
- o Fault time; (fault flow duration)

The report will indicate the value of the totals for the previous day, and the minimum, maximum and average values for the non-total parameters.

In the hourly data section totals and/or averages are indicated in 8 columns. The type of totals/averages can be selected from the list as follows:

- o UVOL; (volume at line conditions)
- o CVOL; (volume at base conditions)
- o Mass; (mass)
- o Energy; (energy)
- o CO2 mass; (CO2 emission mass)
- o Fault UVOL; (volume at line conditions at fault condition)
- o Fault CVOL; (volume at base conditions at fault condition)
- o Fault Mass; (mass at fault condition)
- o Fault Energy; (energy at fault condition)
- o Fault CO2 mass; (CO2 emission mass at fault condition)
- o Premium UVOL; (premium volume at line conditions)
- o Premium CVOL; (premium volume at base conditions)
- o Premium Mass; (premium mass)
- o Premium Energy; (premium energy)
- o Premium CO2 mass; (premium CO2 emission mass)

- o Temp average; (average temperature)
- o Press average; (average pressure)
- o dP average; (average differential pressure)
- o K(Zl/Zb) average; (average compressibility ratio)
- o Spec.carb.average; (average specific carbon content)
- o Inf.cal.val.average; (average inferior calorific value)
- o Sup.cal.val.average; (average superior calorific value)
- o Line dens average; (average line density)
- o Base dens average; (average base density)
- o Rel.dens.average; (average relative density)
- o Flow time; (flow duration)
- o GC updates; (number of times the gas composition has been updated)
- o Fault time; (fault flow duration)

The report will indicate the value of the totals for each hour during the previous day, and the average values for the non-total parameters.

In the footer section space for signature and three company names are provided.

9.2.3.4.3 Trends

Reserved for future use

9.2.3.5 Password setup

Route in the me	enu tree:	
Parameters	General data	Password setup

Function of the F keys on the Password setup data pages

Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

Menu returns to the parent menu

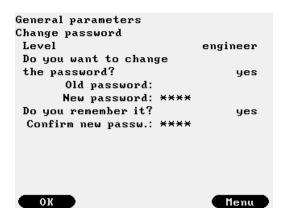

Figure 9-137 Password setup data page

The data fields on the data page are as follows:

- Password level;
 - o operator;
 - o engineer;

The Operator and the Engineer password can be modified here. Only the Engineer is allowed to modify the password for both levels.

First the old password shall be entered.

Then the new password is entered.

UNIFLOW-200 then requires entering the new password once again.

If the new passwords entered twice are identical then the password is changed.

CAUTION

The flow computer shipped with empty password list. It means that pressing Enter when the flow computer requires password you log in at Engineering level allowing modification all the parameters.

Set your own Operator and Engineering level password to protect the parameters against undesired modification. Remember the password you entered. If you forget your password you will have to ask the assistance of the manufacturer or you have to return the unit to the manufacturer.

9.2.3.6 Reset

9.2.3.6.1 Totals reset

Route in the menu tree:

Pre-set fault totals		Parameters	General data	Reset		Clear totals Pre-set cumulative totals Pre-set premium totals Pre-set fault totals
----------------------	--	------------	--------------	-------	--	---

Function of the F keys on the Totals reset data pages **Change** modify the selected data field **OK** Confirm the selection **Save** save the selected/entered data and returns to the parent menu.

Menu returns to the parent menu

General parameters Clear totals You will clear all the totals of the selected stream	
Select stream 1 Str. Do you really want to clear all the totals?	no
OK Change	Menu

Figure 9-138 Totals reset data page

The Totals reset command clears all the cumulative and periodic totals in the flow computer for the selected streams. Totals reset allowed on Engineer password level only.

The data fields on the data page are as follows:

- Select stream;
 - o from 1 to 12;
 - o all;

After the stream or all streams are selected UNIFLOW-200 asks to confirm the reset twice. After confirmation all totals are cleared.

Beside clearing the totals in this menu pre-set value of the cumulative totals can be set also. After selecting the kind of the totals (cumulative, fault or premium) data entry page opens. For all the six totals maintained in the flow computer (CVOL, UVOL, Raw UVOL, Mass, Energy, CO2 mass) any starting value of the counter can be entered.

Main menu 	-Reset -Pre-set cum. tot.	01.mkASZK1 Cumulative totals	
Parameters I	-Pre-set fault tot. -Pre-set prem. tot.	CVOL	154 100 m ³
General data		New value UVOL	36890 m ³

		Raw UVOL New value	36 901 m ³
Totals reset ———		Mass	104802 kg
		New value	
		Energy	5295 GJ
		New value	
		CO2 mass	285 992 kg
		New value	
		Ok Change	Menu

Figure 9-139 Pre-set cumulative totals

Pre-set value allowed to set at no flow condition only, i. e. if flow rates are below the low flow cut-off. Totals pre-set allowed on Engineer password level only. Pre-set of the cumulative totals only allowed.

Pre-set on periodic total is not supported.

9.2.3.6.2 General reset

Route in the men	u tree:		
Parameters	General data	Reset	General reset

Function of the F keys on the General reset data pages

Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

Menu returns to the parent menu

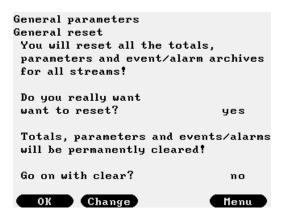

Figure 9-140 General reset data page

The General reset command:

- clears all the cumulative and periodic totals
- clears all the parameters to their default values
- clears the alarm and event log
- sets all I/O signals to inactive
- sets all streams to not defined

in the flow computer.

General reset allowed on Engineer password level only.

Apply the general reset with extreme care.

UNIFLOW-200 asks to confirm the general reset twice. After the two confirmations general reset is done.

9.2.3.7 Version control

Data to identify the flow computer hardware and software elements are provided in this menu.

Route in the men	u tree:	
Parameters	General data	Machine ID

Function of the F keys on the Version control data pages
Change modify the selected data field
OK Confirm the selection
Save save the selected/entered data and returns to the parent menu.

 - 2; 0
- Parity;
 - none; 0 0
 - odd;

o even;

- Port function;
 - o STD Modbus slave;

Measured and calculated data can be read from the Uniflow-200 with standard Modbus communication. See details and the Modbus register map in Chapter 10

- Daniel Modbus slave;
 Measured and calculated data can be read from the Uniflow-200 with Daniel/Omni/Enron Modbus communication.
 See details and the Modbus register map in Chapter 10
- o Ultrasonic meter;

Selecting ultrasonic meter, new entry line appears to select the type of the ultrasonic meter from the list:

- Caldon US master
- Daniel US master
- Flexim US master
- Flowsic-600 US master
- Flowsic-600XT US master
- Krohne US master
- Panamet US master
- QSonic US Uniform
- QSonicPlus US master
- RMA US master
- RMG US master
- Siemens US master
- FMC MPU Series B

Register address for flow rate data read from US meters is displayed.

UVOL flow rate register addresses fixed to

- 2700 for Com1
- 2708 for Com2
- 2716 for Com3
- 2724 for Com4
- 2732 for Com5
- 2740 for Com6
- 2748 for Com7
- 2756 for Com8

Note! In the Modbus signal setup (see 9.2.1.8.) these register addresses must be assigned to the Modbus signal. Modbus mode (RTU or ASCII) and Modbus device address is displayed according to the default settings of the US meter manufacturer.

List of registers read from ultrasonic meter see in 10.7.

o Chromatograph;

Selecting chromatograph, new entry line appears to select the type of the chromatograph from the list:

- ABB GC master;
- ABB2 GC master;
- Daniel C6+ GC master;
- Daniel C9+ GC master;
- Yamatake GC master;
- Yokogawa GC master;
- Encal3000 GC master;

Modbus mode (RTU or ASCII) and Modbus device address is displayed according to the default settings of the chromatograph manufacturer.

List of registers read from chromatographs see in 10.7.

In case of Chromatograph function new data entry lines appear as follows:

- GC number of streams;
 - Selected from the list:
 - o 1 to 4;
- GC str1 -> Stream
 - Selected from the list:
 - o 1, 2, 3, 4, 5, 6, 7, 8;

Selected the serial number of the flow computer physical streams the stream 1 of the gas chromatograph is assigned to. The gas composition measured on stream 1 of the gas chromatograph will be used in the calculations of these streams.

Any number of stream can be assigned to gas chromatograph stream 1.

- GC str2 -> Stream Selected from the list:
 0 1, 2, 3, 4, 5, 6, 7, 8; Same as for GC stream 1
- GC str3 -> Stream Selected from the list:
 0 1, 2, 3, 4, 5, 6, 7, 8; Same as for GC stream 1
- GC str4 -> Stream
 Selected from the list:

 1, 2, 3, 4, 5, 6, 7, 8;

 Same as for GC stream 1
- o Other;

Selecting other, new entry line appears to select the type of the device to communicate with from the list:

• Emerson 3095FB MVT;

Additional data entry lines for Emerson 3095FB multivariable transmitter

- DP differential pressure register address (fixed to 2700 for Com1, 2708 for Com2 and 2716 for Com3);
- SP static pressure register address (shall be selected from the range 4000 to 4058);
- PT temperature register address (shall be selected from the range 4000 to 4058);
- Krohne MFC300 master;

Additional data entry lines for Krohne MFC300 Coriolis flow meter

- Mass flow rate register address (fixed to 2700 for Com1, 2708 for Com2 and 2716 for Com3);
- Line density register address (shall be selected from the range 4000 to 4058);
- Temperature register address (shall be selected from the range 4000 to 4058);
- UVOL flow rate register address (shall be selected from the range 4000 to 4058);
- Counter 1 register address (shall be selected from the range 4000 to 4058);
- Counter 2 register address (shall be selected from the range 4000 to 4058);
- Micromotion master;

Additional data entry lines for Micromotion Coriolis flow meter

- Mass flow rate register address (fixed to 2700 for Com1, 2708 for Com2 and 2716 for Com3);
- Line density register address (shall be selected from the range 4000 to 4058);
- Temperature register address (shall be selected from the range 4000 to 4058);
- Pressure register address (shall be selected from the range 4000 to 4058);
- Meter serial test master; Used in serial test of the flow meters. See. 9.1.8. Mode fixed to ASCII. Number of slaves shall be selected (from 1 to 4 maximum) and Modbus device address for each Slave shall be entered here.
- Meter serial test slave; Used in serial test of the flow meters. See. 9.1.8. Mode fixed to ASCII. Modbus device address for the Slave shall be entered.
- FC calibration Master;

Additional data entry lines for FC calibration Master function

- Data format, available options to select:
- int32 (long integer number);
- float32 (single precision floating point number);
- float64 (double precision floating point number);
- Byte order, available options to select:
 - 1234;
 Example: 123 456 789 = 07 5b cd 15
 Example: 123.456 = 42 f6 e9 79
 3412;
 - Example: 123 456 789 = cd 15 07 5b Example: 123.456 = e9 79 42 f6

- Starting address
 - Starting address of the counter block in the Slave device shall be entered.

In the next four lines four consecutive addresses are displayed. For each address the counter shall be selected from the list

- UVOL (uncorrected volume)
- CVOL (corrected volume)

Mass

Energy

E. g. if the starting address 100 and the data format is 32 bit:

- 100 UVOL (selected from the list UVOL, CVOL, Mass, Energy)
- 102 CVOL (selected from the list UVOL, CVOL, Mass, Energy)
- 104 Mass (selected from the list UVOL, CVOL, Mass, Energy)
- 106 Energy (selected from the list UVOL, CVOL, Mass, Energy)
- Prover slave;

Used in connection with the Prover computer. See uniflow-200 Prover Computer Instruction Manual. Mode fixed to ASCII.

Modbus device address for the Slave shall be entered.

• Serial printer (CP437 setting is suggested);

Additional data entry lines for the serial printer:

- Periodic prints (select if periodic printing is required or not)
 - o **no**

0

No periodic printing will be initiated.

o daily;

The selected reports will be printed at the end of each day.

daily & hourly;

The selected reports will be printed at the end of each da8y and at the end of each hour.

If daily or daily & hourly is selected then list of reports appears. It can then be selected for each of them whether print or not to print at the end of period. The reports selectable for printing are as follows:

- o Defined report 1;
- o Defined report 2;
- o Defined report 3;
- o Defined report 4;
- o Defined report 5;
- o Defined report 6;
- o Defined report 7;
- o Defined report 8;
- o Defined report 9;
- o Defined report 10;
- o Cur.day (hourly short);
- o Batch;
- Mode
 - Selected from the list:
 - o RTU;
 - o ASCII;
- Modb. dev. addr. (Modbus device address); Valid addresses from 0 to 256.
- Resp. delay (Response delay) in milliseconds; Required only if Port type = RS485 or RS422 MD selected. UNIFLOW-200 will not send response to query within this delay time

9.2.4.2 Ethernet port

Route in the men	u tree:		
Parameters	General data	Interfaces	Ethernet

Function of the F keys on the Ethernet port data pages

- select the next field for editing
- select the previous field for editing

⇔ select the next entry field within line

Change modify the selected data field

OK Confirm the selection

Save save the selected/entered data and returns to the parent menu.

Save Figure 9-146 Ethernet port data page

The data fields on the data page are as follows:

- IP address;
- Subnet mask;
- Default gateway;
- Modb. dev. addr. (Modbus device address); Valid addresses from 0 to 256.
- Reg. assignment (Register assignment mode); Selected from the list:
 - o STD Modbus;
 - Communication on the Ethernet port shall be done with standard Modbus. See details in Chapter 10.5.
 - Daniel Modbus; Communication on the Ethernet port shall be done with Daniel/Omni/Enron Modbus. See details in Chapter 10.6.
- DHCP server;
 - Selected from the list:
 - o enabled;
 - o disabled

The factory default settings of the Ethernet port are as follows:IP address:192.168.0.100Subnet mask:255.255.255.0Default gateway:192.168.0.1

Figure 9-148 Keypad values data page

When the data page appears the stream number is highlighted.

Select the stream to be edited pressing the key. Press OK to confirm the selection. The cursor goes to the first editable field. If no gas composition is available in the stream (e.g. the stream measures liquid) then the data page is empty. After pressing Save the cursor goes to the stream select field.

The data fields on the data page are as follows:

- Relative density;
- Inferior calorific value;
- Superior calorific value;
- 21 gas components;
 - The name of the components abbreviated are as follows:
 - N2 nitrogen
 - CO2 carbon-dioxide
 - H2S hydrogen-sulfide
 - H2O water
 - He helium
 - C1 methane
 - C2 ethane
 - C3 propane
 - nC4 n-butane
 - iC4 i-butane
 - nC5 n-pentane
 - iC5 i-pentane
 - nC6 n-hexane
 - nC7 n-heptane
 - nC8 n-octane
 - nC9 n-nonane
 - nC10 n-decane
 - O2 oxygen
 - CO carbon-monoxide
 - H2 hydrogen
 - Ar argon

OK Change	Menu	OK Change	Menu

Figure 9-149 Restore data page

In some cases it might be necessary to return to the parameter set or to the firmware being valid before new parameter set or new firmware was downloaded into UNIFLOW-200.

Entering into Restore menu the Parameter project or the Firmware to be restored shall be selected.

Restore is allowed on Engineer password level only. Apply the Restore with extreme care.

UNIFLOW-200 asks to confirm the Restore twice. After the two confirmations Restore is done.

Be patient. It might take several minutes for Uniflow-200 to finish the restore process.

Never power cycle Uniflow-200 during the restore process. It might make Uniflow-200 unusable and it shall be returned to the manufacturer for repair.

9.2.7 PID Control

9.2.7.1 Operation of the PID control

Uniflow-200 is capable to act as a traditional PID (Proportional Integral Derivative) controller. Maximum of 8 control loops can be configured in each Uniflow-200.

Each control loop can be defined as:

- single loop controller

- dual loop controller for unidirectional flow
- dual loop controller for bidirectional flow

The dual loop controller can be configured to control pressure and flow as follows:

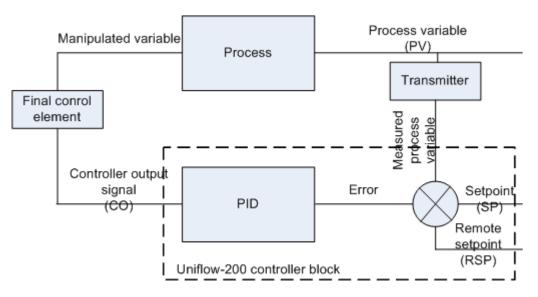

- Pout/max - qmax/q controller

- Pin/min – qmax/q controller

See later the detailed explanation.

9.2.7.1.1 Single loop controller

Block diagram of the single variable control loop is shown on the picture below.

Single variable control loop

Figure 9-150 Single variable control loop

The purpose of the operation of the PID loop is to keep the process variable (PV) as close as possible to the desired set point (SP) by adjusting the manipulated variable.

The process variable is measured directly by sensor or transmitter or calculated from the measured signal. The control block continuously calculates the difference between the current value of the process variable and the setpoint, i. e. the error. If the error is not zero, then the control block modifies the controller output signal. The modified signal gets to the final control element (which is most of the time a control valve) and modify its position. The final control element modifies generally some fluid or energy flow rate (this is the manipulated variable), which affects the value of the process variable in such a way that it gets closer to the setpoint.

In the controller block of the Uniflow-200 the process variable can be selected as:

- analog input (e. g. pressure);

- any calculated flow rate (volume at line conditions, volume at base conditions, mass or energy) of any metering stream.

The controller output signal is one of the analog output signal of the Uniflow-200.

9.2.7.1.2 Dual loop controller

The dual loop controller block consists of two control loops inside one control block.

One of them is a pressure control loop (PIC) the other is a flow control loop (FIC). Both control loops are permanently in operation and based on their own process variable, setpoint and tuning parameters both of them calculate their own controller output signal.

The two signals go through a signal selection block which passes over the lowest signal to the output of the dual loop control block, i. e. to the analog output channel of Uniflow-200 and finally to the final control element.

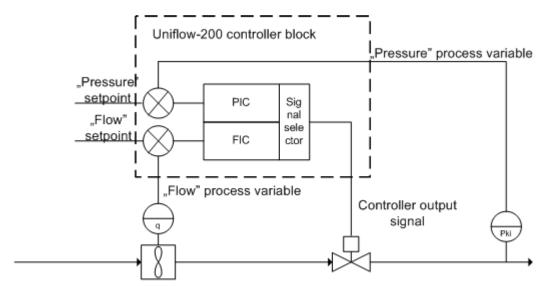

The dual control loop block is designed to perform typical for natural gas industry control functions as follows:

flow control with outlet pressure upper limit control, or, outlet pressure control with flow rate upper limit control (Pout/max – q max/q);

- flow control with inlet pressure lower limit control, or, inlet pressure control with flow rate upper limit control (Pin/min – q max/q); The control function is selected during the set up of the control block.

9.2.7.1.2.1 Dual loop controller with outlet pressure control

Block diagram of the dual loop controller performing flow control with outlet pressure upper limit control, or, outlet pressure control with flow rate upper limit control is shown on the picture below.

Flow rate (q) control with outlet pressure (Pout) upper limit control Outlet pressure (Pout) control with flow rate (q) upper limit control

Figure 9-151 Dual loop controller with outlet pressure control

Operation of the control block is explained through a numerical example below.

The control action of the PIC loop is "reverse" in this configuration. Reverse control action means that in case of positive error (error = PV - SP, i. e. PV > SP, the outlet pressure is higher then the desired outlet pressure) the controller output signal is decreasing (the control valve closes) and in case of negative error (PV < SP, the outlet pressure is lower then the desired outlet pressure) increasing (the control valve opens).

The control action of the FIC loop is also "reverse" in this configuration. It means that in case of positive error (error = PV - SP, i. e. PV > SP, the flow rate is higher then the desired flow rate) the controller output signal is decreasing (the control valve is closing) and in case of negative error (PV < SP, the flow rate is lower then the desired flow rate) increasing (the control valve is opening).

Lets have the FIC loop setpoint 20 000 m3/h and the PIC loop setpoint 60 bar.

Let suppose that the controlled system is in equilibrium which means that the consumers on the pipeline connected to the outlet side of the control valve take off gas quantity from the pipeline equal to the quantity passed through the control valve and fed into the pipeline.

Lets have

- pressure at the inlet side of the control valve: 62 bar
- pressure at the outlet side of the control valve: 58 bar
- output signal of the FIC loop 50 % (this is the lowest from the two output signals so that it gets to the outlet of the control block);
- outlet signal of the PIC loop 100 % (the error = PV (58 bar) SP (60 bar) is negative, so that because of the reverse control action the output signal reaches 100 % after certain period of time);
- volume flow rate through the control valve at 50 % opening stage 20 000 m3/h.

Let suppose that consumers at the outlet side reduced the quantity of the gas taken off from the pipeline. As a consequences the pressure increases at the outlet side of the control valve.

With higher outlet pressure the differential pressure across the valve decreases so that the flow rate through the valve decreases. The FIC control loop will have negative error (= PV - SP), and having reverse control action it will increase the FIC loop output signal. The FIC control loop is trying to increase the flow rate to achieve setpoint.

As the intake flow higher than the off-take flow after certain period of time the pressure reaches the outlet pressure setpoint at the outlet side of the control valve. At that moment the error in the PIC loop become positive so that, because of the reverse control action the PIC loop decreases its output signal. When the decreasing PIC output signal become lower than the increasing FIC loop output signal the PIC loop takes over the control, the output signal of the control block decreases so that the control valves is closing and the flow rate through the valve is decreasing.

PIC loop keeps the outlet pressure at the desired setpoint while the flow rate will be lower than the flow rate setpoint. As far as the error in the FIC loop will be negative all the time, the FIC loop output signal reaches 100 % after certain period of time.

If later the quantity of the gas taken off by the consumers increases then the pressure decreases, the error of the PIC loop become negative and the PIC loop increases its output signal (reverse action) and opens the control valve. The flow rate increases then. When the flow rate reaches the FIC loop setpoint the FIC loop error become positive and the FIC loop decreases its output signal (reverse action).

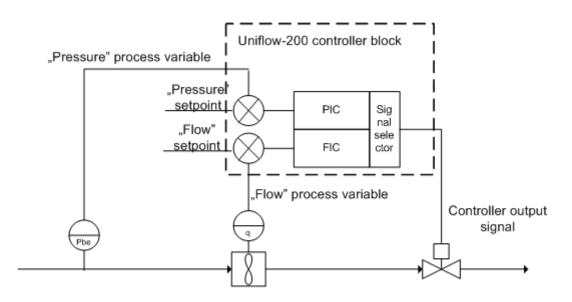

When the decreasing FIC output signal become lower than the increasing PIC loop output signal the FIC loop takes over the control, the output signal of the control block decreases so that the control valves closes and the flow rate through the valve is decreasing. FIC loop keeps the flow reat at the desired setpoint while the outlet pressure will be lower than the outlet pressure setpoint. As far as the error in the PIC loop will be negative all the time, the PIC loop output signal reaches 100 % after certain period of time.

The dual loop controller

- controls the flow rate when the flow rate reaches the FIC loop setpoint (the outlet pressure will be below the PIC loop setpoint in this case) and
- controls the outlet pressure when the outlet pressure reaches the PIC loop setpoint (the flow rate will be below the FIC loop setpoint in this case).

9.2.7.1.2.2 Dual loop controller with inlet pressure control

Block diagram of the dual loop controller performing flow control with inlet pressure lower limit control, or, inlet pressure control with flow rate upper limit control is shown on the picture below.

Flow rate (q) control with inlet pressure (Pin) lower limit control Inlet pressure (Pin) control with flow rate (q) upper limit control

Figure 9-152 Dual loop controller with inlet pressure control

Operation of the control block is explained through a numerical example below.

The control action of the PIC loop is "forward" in this configuration. Forward control action means that in case of positive error (error = PV - SP, i. e. PV > SP, the inlet pressure is higher then the desired inlet pressure) the controller output signal is increasing (the control valve opens) and in case of negative error (PV < SP, the inlet pressure is lower then the desired inlet pressure) decreasing (the control valve closes).

The control action of the FIC loop is "reverse" in this configuration. It means that in case of positive error (error = PV - SP, i. e. PV > SP, the flow rate is higher then the desired flow rate) the controller output signal is decreasing (the control valve closes) and in case of negative error (PV < SP, the flow rate is lower then the desired flow rate) increasing (the control valve opens).

Lets have the FIC loop setpoint 20 000 m3/h and the PIC loop setpoint 60 bar.

Let suppose that the controlled system is in equilibrium which means that the suppliers on the pipeline connected to the inlet side of the control valve put gas quantity into the pipeline equal to the quantity passed through the control valve and taken off from the pipeline.

Lets have

- pressure at the inlet side of the control valve: 62 bar
- pressure at the outlet side of the control valve: 58 bar
- output signal of the FIC loop 50 % (this is the lowest from the two output signals so that it gets to the outlet of the control block);
- outlet signal of the PIC loop 100 % (the error = PV (62 bar) SP (60 bar) is positive, so that because of the forward control action the output signal reaches 100 % after certain period of time);
- volume flow rate through the control valve at 50 % opening stage 20 000 m3/h.

Let suppose that suppliers at the inlet side reduced the quantity of the gas put into the pipeline. As a consequences the pressure decreases at the inlet side of the control valve.

With lower inlet pressure the differential pressure across the valve decreases so that the flow rate through the valve decreases. The FIC control loop will have negative error (= PV - SP), and having reverse control action it will increase the FIC loop output signal. The FIC control loop is trying to increase the flow rate to achieve setpoint.

As the intake flow rate lower than the flow rate through the control valve after certain period of time the pressure reaches the inlet pressure setpoint at the inlet side of the control valve. At that moment the error in the PIC loop become negative so that, because of the forward control action the PIC loop decreases its output signal. When the decreasing PIC output signal become lower than the increasing FIC loop output signal the PIC loop takes over the control, the output signal of the control block decreases so that the control valves is closing and the flow rate through the valve is decreasing.

PIC loop keeps the inlet pressure at the desired setpoint while the flow rate will be lower than the flow rate setpoint.

As far as the error in the FIC loop will be negative all the time, the FIC loop output signal reaches 100 % after certain period of time.

If later the quantity of the gas put by the suppliers into the pipeline increases then the pressure increases, the error of the PIC loop become positive and the PIC loop increases its output signal (forward action) and opens the control valve. The flow rate increases then.

When the flow rate reaches the FIC loop setpoint the FIC loop error become positive and the FIC loop decreases its output signal (reverse action).

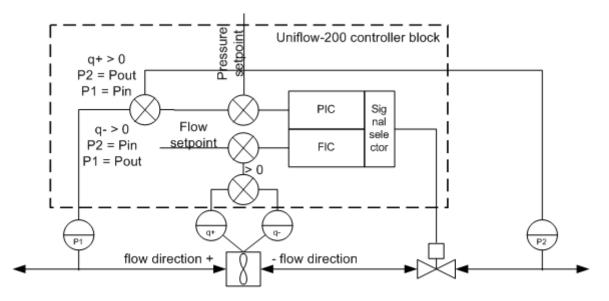

When the decreasing FIC output signal become lower than the increasing PIC loop output signal the FIC loop takes over the control, the output signal of the control block decreases so that the control valves closes and the flow rate through the valve is decreasing. FIC loop keeps the flow rate at the desired setpoint while the inlet pressure will be higher than the inlet pressure setpoint. As far as the error in the PIC loop will be positive all the time, the PIC loop output signal reaches 100 % after certain period of time.

The dual loop controller

- controls the flow rate when the flow rate reaches the FIC loop setpoint (the inlet pressure will be above the PIC loop setpoint in this case) and
- controls the inlet pressure when the inlet pressure reaches the PIC loop setpoint (the flow rate will be below the FIC loop setpoint in this case).

9.2.7.1.2.3 Dual loop controller for bidirectional flow

Block diagram of the dual loop controller for bidirectional flow is shown on the picture below.

Flow rate control with inlet pressue lower limit control Flow rate control with outlet pressue upper limit control

Figure 9-153 Dual loop controller for bidirectional flow

In case of bidirectional flow measurement (e. g. with ultrasonic flow meter) Uniflow-200 measures and totalizes the flow in separate metering streams for the positive (+) and negative (-) flow direction. In the dual loop controller for bidirectional flow the process variable of the FIC loop is automatically selected, depending on the flow direction.

If the outlet pressure is controlled with flow rate control:

- in case of positive flow direction pressure P2 will be the outlet pressure;
- in case of negative flow direction pressure P1 will be the outlet pressure;

If the inlet pressure is controlled with flow rate control:

- in case of positive flow direction pressure P1 will be the inlet pressure;
- in case of negative flow direction pressure P2 will be the inlet pressure;

Depending on the control function to be performed and the flow direction the pressure process variable selected automatically.

Otherwise the controller block works as described in par. 13.6.1.2.1. and 13.6.1.2.2.

9.2.7.2 Calculation algorithm of the controller

Outlet signal of the control loops in the Uniflow-200 is calculated according to the formulas show below.

$$u_k = u_{Pk} + u_{Ik} + u_{Dk}$$

$$u_{Pk} = K_P e_k$$
$$u_{Ik} = u_{Ik-1} + \frac{TK_P}{T_I} e_k$$

$$u_{Dk} = \frac{T_D}{T_D + NT} u_{Dk-1} + \frac{T_D N}{T_D + NT} K_P(e_k - e_{k-1})$$

$$e_k = PV_k - SP_k$$

where:

u – output signal of the control algorithm; K_P – proportional gain;

 T_{I} – integration time, s;

T_D – derivative time, s;

e – error; PV – process variable; SP – setpoint; N – filter constant (N=10) T – calculation cycle time (T = 0.5 s) lower indices P – proportional term; I – integral term; D – derivative term; k – k-th calculation cycle; k-1 – k-1-th calculation cycle ;

9.2.7.3 Set up the PID control

Parameters of the PID control set up can be accessed via menu tree: Main menu / Parameters / PID.

9.2.7.3.1 General set up

Data entry display for the single loop and dual loop controller is shown on the picture below.

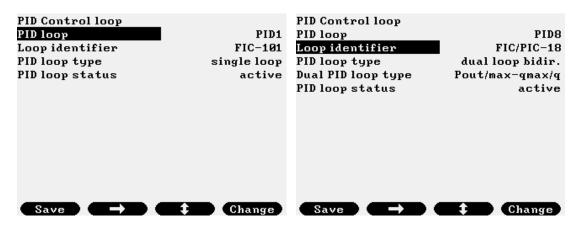

Figure 9-154 PID control loop general setup

Parameters to be set up on this screen are as follows:

PID loop	Identifier of the control loop, selected from list: - PID1; - PID2;
	, - PID8;
Loop identifier	Name of the control loop, any text, e. g. FIC-101
PID loop type	Type of the control loop, selected from list: - single loop - dual loop unidirectional - dual loop bidirectional
Dual PID loop type	(only if dual loop controller) Control task, selected from list: - Pout/max – qmax/q; - Pin/min – qmax/q;
PID loop status	Status of the control loop, selected from list: - active; - inactive;

After setting up the general parameters pressing key \Rightarrow leads to the screen for selecting further group of parameters to be set up:

Main menu Parameters PID1	-Output -Operation -Fault handling -Tuning

Figure 9-155 PID control loop general setup, parameter group selection

There are separate data entry screens to enter parameters related to:

- output

- operation

- fault handling

- tuning

of the control loop.

9.2.7.3.2 Output

Output signal is defined and set up on the screen below. Screen is identical for single and dual loop controller.

PID1 FIC-101 Output Control loop output Output max. ROC Output clamp low limit Output clamp high limit Manual output signal Output rem. manual mode Rem. manual output sign.	-	-	1 ch. 25 %/s 0 % 100 % 29.21 % enabled odbus reg.

Figure 9-161 PID control loop setup, tuning

For single loop controller tuning parameters are according to table below. For dual loop controller tuning parameters are the same but there are separate set of parameters for FIC loop and PIC loop.

Kp1	Gain in tuning set No.1
Ti1	Integration time in tuning set No.1
Td1	Derivative time in tuning set No.1
Kp2	Gain in tuning set No.2
Ti2	Integration time in tuning set No.2
Td2	Derivative time in tuning set No.2
Kp1Ti1Td1/Kp2Ti2Td2 switch over mode	Switch over mode between tuning set No.1 and No.2. Selected from list: - disabled (no switch over, tuning set No.1 in use); - operator (operator selects the tuning set in use); - automatic above the switch over setpoint (tuning set No.2 selected automatically if setpoint is above the given limit); - automatic above the switch over process variable (tuning set No.2 selected automatically if process variable is above the given limit));
Kp1Ti1Td1/Kp2Ti2Td2 selection	Tuning set. Selected from list: - Kp1Ti1Td1; - Kp2Ti2Td2;
SP/PV switch over value	PV or SV limit for automatic switch over between tuning set No.1 and No.2
Integration term disabling low limit	Integration term is disabled below this limit of the controller output signal, $\%$
Integration term disabling high limit	Integration term is disabled above this limit of the controller output signal, $\%$

9.2.7.4 Operation of the PID control

The screen for operation of the PID control is accessible via path Main menu / Flow / PID as shown on the picture below.

Main menu l Flow	Streams -Plant I/O -Archive data -Modbus regs -Data transfer -Extra summ.disp -Batches -Meter serial test

Figure 9-162 Accessing PID control operation screen

After entering into menu select the required PID control loop from PID1 to PID8 by pressing Change button. If inactive PID loop is selected then message shown on the picture below will be displayed.

PID3
This control loop is inactive!
Menu Change

Figure 9-163 PID control operation, control loop inactive screen

Selecting active PID loop and pressing OK the operational screen of the PID loop is displayed.

9.2.7.4.1 Operation of single loop controller

Operational screen of the single loop controller shown on the picture below.

PID1 FIC-101		
Loop identifier	FIC-	101
Process variable	20001	m³/h
Setpoint in use	20000	m³/h
Output signal in use	29.22	×
A/M mode	a	uto
Setpoint mode	loca	I SP
Local setpoint	20000	m³/h
Remote setpoint	60051	m³/h
Output signal calcul-ed	29.22	×
Manual output signal	29.22	×
Rem. manual output sign.	0.00	×
Tuning set in use	Kp1Ti1	Td1
Error status		
Menu Change		

Figure 9-164 PID control operation, single loop controller

Items displayed on the screen are as follows:

Process variable Current value of the process variable measured on the input channel or calculated in the metering stream.

Setpoint in use

Value of the setpoint used in control (local or remote, depending on the setpoint mode).

Output signal in use	Output signal of the control loop going to the analog output.
A/M mode	Auto/Manual mode of the controller, selected from the list: - auto; - manual
Setpoint mode	Setpoint mode selection. Selected from list: - local (SP) - remote (RSP)
Local setpoint	Entry field for local setpoint. If setpoint mode is set to remote and setpoint tracking is enabled then local setpoint follows the remote setpoint.
Remote setpoint	Indicates the value of the remote setpoint received on input channel or in Modbus register
Output signal calculated	The calculated value of the controller output signal.
Output signal manual	Entry field for the output signal. In manual mode it will be the in use output signal. In auto mode, if setpoint tracking is enabled, it follows the calculated value of the output signal.
Output signal remote manual	Manual value of the output signal written via Modbus register. Valid if output remote manual mode is enabled If the PID loop in manual mode, then output signal can be modified writing the desired output signal value into the dedicated Modbus register. See Modbus register map in 13.6.4. The value written into the Modbus register must differ from the previous value of the register to be transferred to the output.
Tuning set in use	The tuning parameter set currently in use. Selected from list: - Kp1Ti1Td1; - Kp2Ti2Td2.
Error status	Error status of the PID loop. Valid error status: - no error - PV invalid - SP invalid

9.2.7.4.2 Operation of dual loop controller

In case of dual loop controller there are separate operational screen for the FIC loop and PIC loop. After selecting the desired loop (FIC or PIC) and pressing \Rightarrow button the operational screen of the selected loop will be displayed.

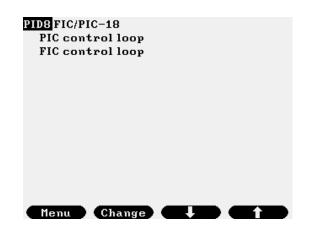

Figure 9-165 PID control operation, dual loop controller

The operational screen of the PIC loop is shown on the picture below.

PID8 FIC/PIC-18	DIC lass	PID8 FIC/PIC-18	PIC loop
	PIC loop		-
Loop identifier	FIC/PIC-18	PIC process variable	54.99 bar
Dual PID loop type	Pout/max-qmax/q	PIC setpoint in use	54.99 bar
Flow direction	(+) direction	Output signal in use	25.00 ×
PIC process variable	54.98 bar	Output signal mode	manual
PIC setpoint in use	54.98 bar	A/M mode	manual
Output signal in use	25.00 ×	Setpoint mode	local SP
Output signal mode	manual	Local SP / Poutmax / Pinmin	54.99 bar
A/M mode	manual	Rem. SP/Poutmax/Pinmin	0.00 bar
Setpoint mode	local SP	Output signal calcul-ed	25.00 ×
Local SP / Poutmax / Pinr	nin 54.98 bar	Manual output signal	25.00 ×
Rem. SP/Poutmax/Pinmin	0.00 bar	Rem. manual output sign.	0.00 ×
Output signal calcul-ea	l 25.00 %	Tuning set in use	Kp1Ti1Td1
Manual output signal 🔄	25.00 ×	Error status	

Figure 9-166 PID control operation, dual loop controller, PIC loop

Dual PID loop type	The control task selected during the set up for the dual loop controller (Pout/max – qmax/q or Pin/min – qmax/q) not alterable here.
Flow direction	Current flow direction, positive (+) or negative (-) indicated. Not alterable here.
PIC process variable	Current value of the process variable measured on the input channel
PIC setpoint in use	Value of the setpoint used in control (local or remote, depending on the setpoint mode).
Output signal in use	Output signal of the dual control block going to the analog output.
Output signal mode	Indicates which control loop calculated output signal goes to the output of the control block. Valid values are: PIC (if the calculated output signal of the PIC loop is in use) FIC (if the calculated output signal of the FIC loop is in use) Manual (if control loop in manual mode
A/M mode	Auto/Manual mode of the controller, valid for both PIC and FIC loop, selected from the list: - auto; - manual.
Setpoint mode	Setpoint mode selection. Selected from list: - local (SP) - remote (RSP)
Local setpoint/Poutmax/ Pinmin	Entry field for local setpoint. In case of Pout/max – qmax/q control, value of the Poutmax In case of Pin/min – qmax/q control, value of the Pinmin If setpoint mode is set to remote and setpoint tracking is enabled then local setpoint follows the remote setpoint.
Remote setpoint/Poutmax/Pinmin	Indicates the value of the remote setpoint received on input channel or in Modbus register. In case of Pout/max – qmax/q control, value of the Poutmax In case of Pin/min – qmax/q control, value of the Pinmin
Output signal calculated	The calculated value of the PIC loop output signal.
Output signal manual	Entry field for the output signal. In manual mode it will be the in use output signal. In auto mode, if setpoint tracking is enabled, it follows the calculated value of the output signal.
Output signal remote manual	Manual value of the output signal written via Modbus register. Valid if output remote manual mode is enabled. If the PID loop in manual mode, then output signal can be modified writing the desired output signal value into the dedicated Modbus register. See Modbus register map in 13.6.4. The value written into the Modbus register must differ from the previous value of the register to be transferred to the output.
Tuning set in use	The tuning parameter set currently in use in the PIC loop. Selected from list: - Kp1Ti1Td1; - Kp2Ti2Td2.
Error status	Error status of the PIC loop. Valid error status: - no error

- PV invalid - SP invalid

The operational screen of the FIC loop is shown on the picture below.

PID8 FIC/PIC-18	FIC loop	PID8 FIC/PIC-18	FIC loop

Dual PID loop type	The control task selected during the set up for the dual loop controller (Pout/max – qmax/q or Pin/min – qmax/q) not alterable here.
Flow direction	Current flow direction, positive (+) or negative (-) indicated. Not alterable here.
FIC process variable	Current value of the process variable measured on the input channel or calculated in the metering stream.
FIC setpoint in use	Value of the setpoint used in control (local or remote, depending on the setpoint mode).
Output signal in use	Output signal of the dual control block going to the analog output.
Output signal mode	Indicates which control loop calculated output signal goes to the output of the control block. Valid values are: PIC (if the calculated output signal of the PIC loop is in use) FIC (if the calculated output signal of the FIC loop is in use) Manual (if control loop in manual mode
A/M mode	Auto/Manual mode of the controller, valid for both PIC and FIC loop, selected from the list: - auto; - manual.
Setpoint mode	Setpoint mode selection, valid for both PIC and FIC loop, selected from list: - local (SP) - remote (RSP)
Local setpoint/qmax	Entry field for local setpoint. In case of Pout/max – qmax/q or Pin/min – qmax/q control, value of the qmax. If setpoint mode is set to remote and setpoint tracking is enabled then local setpoint follows the remote setpoint.
Remote setpoint/qmax	Indicates the value of the remote setpoint received on input channel or in Modbus register. In case of Pout/max – qmax/q control Pin/min – qmax/q control, value of the qmax.
Output signal calculated	The calculated value of the FIC loop output signal.
Output signal manual	Entry field for the output signal. In manual mode it will be the output signal in use. In auto mode, if setpoint tracking is enabled, it follows the calculated value of the output signal.
Output signal remote manual	Manual value of the output signal written via Modbus register. Valid if output remote manual mode is enabled. If the PID loop in manual mode, then output signal can be modified writing the desired output signal value into the dedicated Modbus register. See Modbus register map in 13.6.4. The value written into the Modbus register must differ from the previous value of the register to be transferred to the output.
Tuning set in use	The tuning parameter set currently in use in the FIC loop. Selected from list:

Error status

Kp2Ti2Td2.
 Error status of the FIC loop.
 Valid error status:
 no error

- PV invalid
- SP invalid

- Kp1Ti1Td1;

9.2.7.5 Modbus register map of the PID control parameters

Uniflow-200 communication description see in Annex A. In this paragraph the Modbus register map related to PID control is described.

Table below gives the register addresses of the parameters which can be read or write via communication interface of Uniflow-200. Meaning of letter X in the register addresses in the table:

X = 1 -for PID loop PID1

X = 2 -for PID loop PID2

X = 8 – for PID loop PID8

There are 2 sets of register addresses in the table, "Standard Modbus" and "Daniel Modbus".

If the communication with Uniflow-200 accomplished via serial port with port function set to "STD Modbus slave" or via Ethernet port with register assignment set to "STD Modbus" then "Standard Modbus" registers shall be addressed.

If the communication with Uniflow-200 accomplished via serial port with port function set to "Daniel Modbus slave" or via Ethernet port with register assignment set to "Daniel Modbus" then "Daniel Modbus" registers shall be addressed.

Changing the "modes" shall be dona writing the appropriate code into registers marked with rw (read/write).

Statuses shall be read from the registers marked with ro (read only).

No.	Description	Standard Modbus register address	Daniel Modbus register address	rw= read/write ro= read only int=16 bit integer float=32 bit float	Note

Table 9-15 Modbus register map of the PID control parameters

9.3 Alarms and events system

UNIFLOW-200 operates a comprehensive alarming and eventing system, a summary of which is described below.

Alarm is considered as a violation of a limit set in the flow computer by operator or by the calculation procedure implemented.

Event is considered any change in the parameter set of the flow computer.

When an alarm occurs, it causes:

- visual alarm indication (alarm LED on the front panel) flashing;
- digital alarm output activated;
- entry is added to the unacknowledged alarm list;
- entry is added to the alarm log (alarm set).

When operator acknowledges the alarm:

- it is moved from the unacknowledged alarm list to the acknowledged alarm list;
- alarm led is lit (not flashing);

When the limit violation causing the alarm disappears:

- alarm LED goes off;
- digital alarm output deactivated;
- alarm is cleared from the alarm list (from the acknowledged alarm list if it was acknowledged and from the unacknowledged alarm list if it was not acknowledged. Alarm system works on unlatched basis)
- entry is added to the alarm log (alarm cleared).

When any event appears:

- entry is added to event log indicating the name of the parameter modified, the old value and the new value of the parameter.

There is also a download log in the flow computer. It serves for archiving the natural gas composition downloaded to the flow computer from supervisory system via the Modbus link.

Every time a new gas composition is received on the Modbus link the composition is stored in the download log as a new entry.

The alarm log, event log and download log content is not alterable.

9.3.1 I/O channel alarms

Alarm text	Description
IO/Ch Under range	Current < 3.5 mA. Alarm is cleared with hysteresis when current > 4 mA. In the range 3.5 mA < current < 4.0 mA current = 4.0 mA converted into engineering unit.
IO/Ch Over range	Current > 20.5 mA. Alarm is cleared with hysteresis when current < 20 mA. In the range 20.0 mA < current < 20.5 mA the measured current is converted into engineering unit.
IO/Ch LoLo limit	Parameter in engineering unit < LoLo alarm limit
IO/Ch Lo limit	Parameter in engineering unit < Lo alarm limit
IO/ChHi limit	Parameter in engineering unit > Hi alarm limit
IO/ChHiHi limit	Parameter in engineering unit > HiHi alarm limit
IO/Ch channel failure	Channel data is failed to read
Str dP cut-off active	For differential pressure channel only.
	Measured dP < dP cut-off limit. dP = 0 assumed in flow calculation.
Str dP transmitter discrepancy	For differential pressure channel only if two or three dP transmitters with identical range is configured. Deviation between the differential pressures measured at different channels > deviation limit.

9.3.1.1 Analog input channel (4-20 mA) alarms

Differential pressure signal processing in different regions of the input signal is shown in the table below.

dP_max dP_HI_current	 transmitter overload (I > 20.5 mA) transmitter upper range value (I = 20.0 mA)
	dP cut-off limit transmitter lower range value (I = 4.0 mA) open input circuit (I < 3.5 mA)

dP range	Alarm	dP signal processing
0 < dP < dP_min	Under-range	No flow calculation
dP_min < dP < dP_LO_current	Under-range	No flow calculation
dP_LO_current < dP < dP_cut-off	dP cut-off active	dP = 0 assumed
dP_cut-off < dP < dP_HI_current	none	normal flow calculation
dP_HI_currnt < dP < dP_max	none	normal flow calculation
dP_max < dP	Over-range	dp = dP_max assumed, fault totals

NOTE

It is operator selectable in the signal setup menu if the under range, over range and Lo, LoLo, Hi, HiHi limits shall generate alarm or not.

9.3.1.2 PRT/RTD (Pt100) channel alarms

Alarm text	Description
IO/Ch Under range	Temperature < LO_scale.
IO/Ch Over range	Temperature > HI_scale.
IO/Ch LoLo limit	Temperature < LoLo alarm limit
IO/Ch Lo limit	Temperature < Lo alarm limit
IO/ChHi limit	Temperature > Hi alarm limit
IO/ChHiHi limit	Temperature > HiHi alarm limit

NOTE

It is operator selectable in the signal setup menu if the under range, over range and limits shall generate alarm or not.

9.3.1.3 Pulse input channel (flow pulse signal) alarms

Alarm text	Description
Str flowrate cut-off active	UVOL flowrate < cut-off flowrate
Str flowrate below qmin	UVOL flowrate < qmin flowrate

IO/Ch LoLo limit	UVOL flowrate < LoLo alarm limit
IO/Ch Lo limit	UVOL flowrate < Lo alarm limit
IO/ChHi limit	UVOL flowrate > Hi alarm limit
IO/ChHiHi limit	UVOL flowrate > HiHi alarm limit
Str., flowrate above qmax	UVOL flowrate > qmax flowrate
Str meter overload	UVOL flowrate > tm * qmax flowrate
Str meter critical overload	UVOL flowrate > 1.5 * tm * qmax flowrate

where *tm* is the maximum overload set in the signal setup menu

Pulse input signal processing in different regions of the input signal is shown in the table below.

1.5 * tm * q_ma tm * qmax qmax	AX 	critical overload flowrate maximum overload flowrate maximum UVOL flowrate
qmin q_cut-off 0		minimum UVOL flowrate cut-off UVOL flowrate no flow

UVOL FR range	Alarm	Signal processing
0 < UVOL FR < q_cut-off	flowrate cut-off active	No flow totalization
q_cut-off < UVOL FR < qmin	under range	Fault totals
qmin < UVOL FR < qmax	none	Normal flow calculation
qmax < UVOL FR < tm * qmax	over range	Fault totals
tm * qmax < UVOL FR < 1.5 * tm * qmax	overload	Fault totals
1.5 * tm * qmax < UVOL FR	critical overload	No data () is displayed for all flow rates.
		No flow totalization

The flowrate is calculated in any cases independently on that if the totalization is allowed or not.

NOTE

It is operator selectable in the signal setup menu if the Lo, LoLo, Hi, HiHi limits shall generate alarm or not.

9.3.1.4 Pulse input channel (flow frequency signal) alarms

Alarm text	Description
Alarm text	Description
IO/Ch Under range	Frequency < LO_frequency
IO/Ch Over range	Frequency > HI_frequency
IO/Ch LoLo limit	Parameter in engineering unit < LoLo alarm limit
IO/Ch Lo limit	Parameter in engineering unit < Lo alarm limit
IO/ChHi limit	Parameter in engineering unit > Hi alarm limit
IO/ChHiHi limit	Parameter in engineering unit > HiHi alarm limit

NOTE

It is operator selectable in the signal setup menu if the under range, over range and Lo, LoLo, Hi, HiHi limits shall generate alarm or not.

9.3.1.5 Pulse input channel (density frequency signa	al) alarms
--	------------

Alarm text	Description
IO/Ch Under range	Parameter in engineering unit < LO_scale
IO/Ch Over range	Parameter in engineering unit > HI_scale
IO/Ch LoLo limit	Parameter in engineering unit < LoLo alarm limit
IO/Ch Lo limit	Parameter in engineering unit < Lo alarm limit
IO/ChHi limit	Parameter in engineering unit > Hi alarm limit
IO/ChHiHi limit	Parameter in engineering unit > HiHi alarm limit

NOTE

It is operator selectable in the signal setup menu if the under range, over range and Lo, LoLo, Hi, HiHi limits shall generate alarm or not.

Alarm text	Description
IO/Ch Under range	Parameter in engineering unit < LO_scale
IO/Ch Over range	Parameter in engineering unit > HI_scale
IO/Ch LoLo limit	Parameter in engineering unit < LoLo alarm limit
IO/Ch Lo limit	Parameter in engineering unit < Lo alarm limit
IO/ChHi limit	Parameter in engineering unit > Hi alarm limit
IO/ChHiHi limit	Parameter in engineering unit > HiHi alarm limit

9.3.1.6 Analog output (4-20 mA) channel alarms

NOTE

It is operator selectable in the signal setup menu if the under range, over range and Lo, LoLo, Hi, HiHi limits shall generate alarm or not.

9.3.1.7 Pulse output channel alarms

Alarm text	Description
IO/Ch Pulse output	Number of pulses to be output > 10 sec * max. output frequency
overload	

This alarm may appear if a digital output is configured to output pulses proportional to total and the K-factor (volume/pulses) is improperly set. If the number of accumulated pulses to be output is more then the number of pulses the flow computer capable to output at maximum frequency during 10 seconds then pulse output overload alarm appears.

9.3.1.8 Modbus (serial communication) channel alarms

Alarm text	Description
Str data update timeout	No new data is received within the timeout time.

This alarm appears if the Modbus channel signal is not updated (not written by external device) within the timeout time specified in the signal setup menu for that channel.

9.3.2 Metering stream alarms

9.3.2.1 Calculation alarms

This type of alarms related to the calculation algorithm implemented for particular flow calculation. The alarms and the consequences in the flow calculation listed in the table below.

Alarm text	Cause of alarm	Consequences
Gas composition out of	The total of the natural gas component	Alarm and keypad composition is
range	concentrations received on Modbus link is outside	used in the calculation
	the 95 105 % range	
Gas quality out of	One or more component concentration is outside	Alarm but the calculation proceeds.
range	the range defined in the calculation standard (e.g. AGA8).	
Gas quality out of	One or more component concentration is outside	Alarm and the calculation proceeds.
extended range	the extended range defined in the calculation	
	standard (e.g. AGA8).	
Turbine input error	Error in the main and check pulse train ratio.	Alarm but the calculation proceeds.
dP/P ratio out of range	The dP/P ratio out of the range determined by the standard.	Alarm but the calculation proceeds.
Pipe diameter out of	The pipe diameter out of the range determined by	Alarm but the calculation proceeds.
the range	the standard.	
Orifice diameter out of	The orifice diameter out of the range determined by	Alarm but the calculation proceeds.
the range	the standard.	
Beta ratio out of the	The beta ration out of the range determined by the	Alarm but the calculation proceeds.
range	standard.	
Reynolds number out	The Reynolds number out of the range determined	Alarm but the calculation proceeds.
of the range	by the standard.	
ISO5167 calculation	No convergence is reached in the ISO 5167	Alarm and the calculation stops.
fail	calculation within 10 iterative cycle.	
AGA8 calculation fail	No convergence is reached in the AGA 8	Alarm and the calculation stops.
	calculation within 10 iterative cycle.	

I/O channel signal representing flow (for example differential pressure or pulse input from turbine meter) has no keypad value. In case of failure of this kind of signals the flow calculation is stopped.

I/O signal other then flow signal (for example pressure or temperature) has keypad value. In case of failure of this kind of signal the flow calculation is continued with the keypad value of the signal.

The complete list of alarms and events listed in 9.3.4.

9.3.2.2 Stream fault alarm

This is a common alarm for the stream.

If any of the stream related alarm(s) (see list in the 9.3.4.) is active, the stream fault alarm will be activated and entry into the alarm log will be registered.

Stream fault alarm can be assigned to any digital output so that the status of the digital output will indicate presence of the stream fault alarm.

9.3.3 Common alarm and status output

Common alarm

A common alarm is defined in UNIFLOW-200.

If any of the I/O or metering stream alarm is active then the common alarm becomes active as well.

The common alarm can be assigned to a digital output channel providing alarm signal for external devices.

The alarm LED on the front panel and the common alarm output change their state as indicated in the table below.

Common alarm	Alarm LED	Alarm output
unacknowledged alarm exists	flashing red	open(*)
acknowledged alarm only exists	constant red	open(*)
no alarm	not lit	closed(*)

(*) The digital output can be configured to be normally open or normally closed.

9.3.3.1 Status output

The run LED on the front panel and the change over voltage free contact output is provided to signal the operational status/fault of the flow computer.

The run LED and the status output change their state as indicated in the table below.

Flow computer status	RUN LED	Status output	
		In operation output	In fault output
Operating	lit	closed	open
Faulty	not lit	open	closed

9.3.4 Alarm list

Potential alarms in UNIFLOW-200 are listed in the table below. Entry is created in the **alarmlog.txt** file when any of these alarms appear (SET), acknowledged (ACK) and disappear (CLR).

I/O Channel related alarms

1 IOn/Chm Data update timeout No new data is received within the timeout time.	
2 IOn/Chm Hi limit Measured value > Hi alarm limit	
3 IOn/Chm HiHi limit Measured value > HiHi alarm limit	
4 IOn/Chm IO channel failure Channel data is failed to read	
5 IOn/Chm Lo limit Measured value < Lo alarm limit	
6 IOn/Chm LoLo limit Measured value < LoLo alarm limit	
7 IOn/Chm Over range Measured value > Hi scale	
8 IOn/Chm Pulse input overload Measured frequency > 12 kHz	
9 IOn/Chm Pulse output overload Pulses to be output requires more then 10 s	
10 IOn/Chm Under range Measured value < Lo scale	

Stream related alarms

No. Pi	refix	Alarm	Description No convergence is reached in the AGA 8 calculation within 10
1 St	trn	AGA8 calculation fail	iterative cycles.
2 St	trn	AGA8 extended over-range	Gas composition out of the extended AGA8 range
3 St	trn	AGA8 over-range	Gas composition out of the AGA8 range
4 St	trn	Base density out of range	Base density out of the range determined by the standard
5 St	trn	Beta ratio out of the range	The beta ratio out of the range determined by the standard.
6 St	trn	Critical over load	UVOL flowrate > 1.5 * tm * qmax
7 St	trn	CVOL FR above prem.limit	Volume at base conditions flow rate above premium limit
8 St	trn	CVOL FR above prem.limit	Volume at base conditions flow rate premium limit warning
9 SI	itrn	Densitometer error	Error in densitometer signal No convergence is reached in the density calculation within 10
10 St	trn	Density calculation fail	iterative cycles.
11 Si	trn	Density converg error	Density calculation convergence error Deviation between the densities measured in two
12 St	trn	Density discrepancy	densitometers > deviation limit.
13 St	trn	dP cut-off active	Measured dP < dP cut-off limit

14 Strn	dP transmitter discrepancy	Deviation between the differential pressures measured at different channels > deviation limit.
15 Strn	dP/P ratio out of range	The dP/P ratio out of the range determined by the standard
16 Strn	Dynamic viscosity error	Dynamic viscosity error
17 Strn	ENGY FR above prem.limit	Energy flow rate above premium limit
18 Strn	ENGY FR above prem.limit	Energy flow rate premium limit warning
19 Strn	Flowrate cut-off active	0 < UVOL flowrate < q_cut-off The total of the natural gas component concentrations received
20 Strn	Gas composition out of range	on Modbus link is outside the 95 105 % range One or more component concentration is outside the extended
21 Strn	Gas quality out of extended range	range defined in the calculation standard (e.g. AGA8). One or more component concentration is outside the range
22 Strn	Gas quality out of range	defined in the calculation standard (e.g. AGA8). No new gas composition data is received within the timeout
23 Strn	Gas quality update timeout	time.
24 Strn	Increment OOR	Integration increment out of range
25 Strn	Invalid fluid	Invalid fluid selection No convergence is reached in the ISO 5167 calculation within
26 Strn	ISO5167 calculation fail	10 iterative cycles.
27 Strn	Joule-Thomson Err.	Joule-Thomson coefficient calculation error
28 Strn	Line dens. error	Line density error
29 Strn	Mass FR above prem.limit	Mass flow rate above premium limit
30 Strn	Mass FR above prem.limit	Mass flow rate premium limit warning
31 Strn	Modbus slave error	Modbus slave error
32 Strn	NGL/LPG Consistency Error	NGL/LPG calculation consistency error
33 Strn	NGL/LPG Ctl Error	NGL/LPG Ctl error
34 Strn	NGL/LPG Ctl iteration Error	NGL/LPG Ctl iteration error
35 Strn	NGL/LPG Gamma60 Error	NGL/LPG calculation gamma60 error
36 Strn	NGL/LPG Gamma60 iteration Error	NGL/LPG calculation gamma60 iteration error
37 Strn	NGL/LPG range Error	NGL/LPG calculation range error
38 Strn	NGL/LPG Tr > Tc Error	NGL/LPG Tr > Tc error
39 Strn	Orifice diameter out of the range	The Orifice diameter out of the range determined by the standard.
40 Strn	Out of range PT	Pressure and tempearture out of range
41 Strn	Over load	UVOL flowrate > tm * qmax (tm = max. load, %)
42 Strn	Over range	UVOL flowrate > qmax
43 Strn	P2/P ratio out of range	The P2/P ratio out of the range determined by the standard
44 Strn	Pipe diameter out of the range	The pipe diameter out of the range determined by the standard.
45 Strn	Press. > Steam sat. press.	Pressure > Steam saturation pressure
46 Strn	Pressure extend OOR	Pressure out of extended range
47 Strn	Pressure OOR	Pressure out of range Failed to determine the type of refined product on the basis of
48 Strn	Product selection failure	base density
49 Strn	Pulse input error	Error in the main and check pulse train ratio. The Reynolds number out of the range determined by the
50 Strn	Reynolds number out of the range	standard
51 Strn	Steam calculation failed	Steam calculation failed
52 Strn	Steam calculation warning	Steam calculation warning
53 Strn	Steam sat. press. alarm	Steam saturation pressure alarm
54 Strn	Structural dP overload	Differential pressure > structural maximum dP for Annubar
		- 234 -

55 Strn	Temperature out of extended range	The temperature out of the extended range determined by the standard
56 Strn	Temperature out of range	The temperature out of the range determined by the standard
57 Strn	Transmitter setting failure	Failed to set the transmitter range
58 Strn	Under range	UVOL flowrate < qmin
59 Strn	UVOL FR above prem.limit	Volume at line conditions flow rate above premium limit
60 Strn	UVOL FR above prem.limit	Volume at line conditions flow rate premium limit warning
61 Strn	VCR out of range	Volume correction factor out of range
62 Strn	Water not liquid	Error in water-steam phase calculation
63 Strn	US meter common alarm	Alarm state is active in the US meter assigned to the stream n.

9.3.5 Events list

Events in UNIFLOW-200 are listed in the table below. Entry is created in the **eventlog.txt** file when any of these events appear.

No. Prefix	Alarm	Description
1 date/time	Application software update	Application software updated
2 date/time	Date/time downloaded	Date/time updated via Modbus Daylight saving time period ended (European DST rule is
3 date/time	DST off	followed)
4 date/time	DST off failed	Failed to end daylight saving time period Daylight saving time period started (European DST rule is
5 date/time	DST on	followed)
6 date/time	DST on failed	Failed to start daylight saving time period
7 date/time	Engineer logged in	Operator at engineer password level logged in All the parameters, totals, alarms, event are cleared for all
8 Strn	General reset	streams
9 date/time	Guest logged in	Operator at guest password level logged in
10 date/time	IP address conflict	IP address conflict
11 Strn	New gas composition received	New gas composition received
12 date/time	no. of calc. cycles	Number of calculation cycles
13 date/time	Operator logged in	Operator at operator password level logged in
14 date/time	Parameter setup aborted	Parameter setup aborted
15 date/time	Parameter setup start	Operator entered Parameters menu
16 date/time	Parameter setup stop	Operator left Parameters menu
17 date/time	Power failure	Power failure or power off
18 date/time	Remote parameter setup	Parameters are modified via ethernet interface
19 Strn	Totals reset	Totals are cleared to the selected streams Flow computer restarted after power on or application
20 date/time	Warm start	download
21 date/time	Watchdog restart	Flow computer restarted from watchdog circuit

9.3.6 Download log

Gas composition downloaded into UNIFLOW-200 is stored in the **downloadlog.txt** file. The structure of the file is as follows.

In case of measuring natural gas using Modbus Daniel mode for the first stream:

Line	Modbus registers (Modb.		
1.	Daniel): ;7001;7002;7003;700	4;7005;7006;7007;7008;7009;7010;7011	;7012;7013;7014;7015;7016;701

Line	Parameters: ;N2;CO2;H2S;H20;He;C1;C2;C3;nC4;iC4;nC5;iC5;nC6;nC7;nC8;nC9;nC10;O2;CO	;H2;rRo;ICV;SCV;Ar;LD;BD;
2.		
Line	Timestamp Str1 ;gas composition data	
п.		

In case of measuring natural gas using Modbus STD1 mode for all streams:

Line 1.	Modbus registers (Modb.
	STD1): ;818;820;822;824;826;828;830;832;834;836;838;840;842;844;846;848;850;852;854;856; 858;860;
Line 2.	Parameters: ;N2;CO2;H2S;H20;He;C1;C2;C3;nC4;iC4;nC5;iC5;nC6;nC7;nC8;nC9;nC10;O2 ;CO;H2;RD;ICV;
Line n.	Timestamp Str1-8 ;gas composition data

In case of mesuring natural gas using Modbus STD2 mode for the first stream:

Line	Modbus registers (Modb.
1.	STD2): ;878;880;882;884;886;888;890;892;894;896;898;900;902 ;904;906;908;910;912;914;916;918;920;870;872;874;876;
Line	Parameters: ;N2;CO2;H2S;H20;He;C1;C2;C3;nC4;iC4;nC5;iC5;nC6;nC7;nC8;nC9;nC10;O2 ;CO;H2;RD;ICV;SCV;Ar;LD,BD
2.	
Line	Timestamp Str1 ;gas composition data
п.	

In case of mesuring coke oven gas using Modbus Daniel mode for the first stream:

Line 1.	Modbus registers (Modb. Daniel): ;7001;7002;7003;7004;7006;7007;7008;7018;7019;7020	;7028;7029;
Line 2.	Parameters: ;N2;CO2;H2S;H20;C1;C2;C3;O2;CO;H2;Ammonia;Benzene;	
Line n.	Timestamp Str1 ;gas composition data	

In case of mesuring coke oven gas using Modbus STD2 mode for the first stream:

Line 1.	Modbus registers (Modb. STD2): ;878;880;882;884;888;890;892;912;914;916;1310;1312;
Line 2.	Parameters: ;N2;CO2;H2S;H20;C1;C2;C3;O2;CO;H2;Ammonia;Benzene;
Line n.	Timestamp Str1 ;gas composition data

In case of mesuring blast furnace gas using Modbus Daniel mode for the first stream:

Line 1.	Modbus registers (Modb. Daniel): ;7001;7002;7004;7019;7020;
Line 2.	Parameters: ;N2;CO2;H20;CO;H2;
Line <i>n</i> .	Timestamp Str1 ;gas composition data

In case of mesuring blast furnace gas using Modbus STD2 mode for the first stream:

Line 1.	Modbus registers (Modb. STD2): ;878;880;884;914;916;
Line 2.	Parameters: ;N2;CO2;H20;CO;H2;
Line n.	Timestamp Str1 ;gas composition data

9.4 Tests

The Test menu is intended for quick check of the I/O signals of the flow computer. It also includes menu items to monitor data exchange on serial ports and on the Modbus TCP port. Entering Tests menu does not interrupt the flow calculation of the metering streams however it may affect the output signals.

NOTE

Remove all the field output signal connectors from the flow computer before entering the Test menu. The test values of the output signals (current on the 4-20 mA output channel and state on the digital output channel) set in the Tests menu will appear on the output terminals of the flow computer. These artificial outputs may disturb the normal operation of the equipment connected to the flow computer.

Main menu	IO Board 1

Figure 9-174 Tests – PITC4641 board data page

The frequency and the pulse counter for the main and check pulse inputs are indicated for the pulse input channels. Frequency output indicates the frequency passed from one of the pulse input channels to the raw pulse output channel. Active when one of the streams defined in the flow computer is selected for proving in the connecting prover computer. See in Uniflow-200 Prover Computer Instruction Manual.

The state (opened or closed) is indicated for digital input and output channels.

Selecting digital output channel, the state of the channel can be set to opened or closed.

Leaving the data page UNIFLOW-200 restores the outputs to the value determined by the application.

9.4.7 Tests – Com port monitor

 Route in the menu tree:

 Tests
 Com port monitor

Entering the Com port monitor menu, a warning message will be displayed: "When using Com port monitor, ensure that only one client is polling the Com port."

Pressing OK, lead us to the setup data page.

Function of the F keys on the Tests - Com port monitor, setup pages

- select the next field for editing
- f select the previous field for editing
- Change modify the selected data field
- **OK** Confirm the selection
- Start start monitoring the traffic on the Com port

Com port monitor Interface	Com1
Time stamp	relative
Start Change	

Figure 9-175 Tests – Com port monitor, setup

The data fields on the data page are as follows:

- Interface;
 - o Coml;
 - o Com2;
 - o Com3;
- Time stamp;
 - o absolute; (real time clock time)
 - o relative; (start of the monitoring is considered as zero time)
 - o between messages; (time elapsed between messages is displayed)

After selecting the Com port and timestamp format, the Start button leads us to the monitoring page.

9.4.8 Tests – Modbus TCP monitor

Route in the menu tree: Tests Modbus TCP monitor

Entering the Modbus TCP monitor menu, a warning message will be displayed: "When using Modbus TCP monitor, ensure that only one client is polling the Modbus TCP port."

Pressing OK, lead us to the setup data page.

Function of the F keys on the Tests - Modbus TCP port monitor data pages

select the next field for editing

f select the previous field for editing

Change modify the selected data field

OK Confirm the selection

Start start monitoring the traffic on the Com port

ne com port	
Modbus TCP monitor	
Client IP address	169.254.100. 1
Time stamp	absolute

Figure 9-178 Tests – Modbus TCP port monitor, setup

The data fields on the data page are as follows:

- Client IP address;
 - Enter the IP address of the client which will poll the Modbus TCP port.
- Time stamp;
 - o absolute; (real time clock time)
 - o relative; (start of the monitoring is considered as zero time)
 - o between messages; (time elapsed between messages is displayed)

After entering the Client IP address and timestamp format, the Start button leads us to the monitoring page.

The monitoring of the traffic, the scrolling on the display and the saving traffic data into log file identical with the items described for the Com port monitoring.

The log file name convention is as follows: tcp_yyyy_mm_dd_hh_mm_ss.txt where yyyy_mm_dd_hh_mm_ss - is the time stamp (the start time of the monitoring)

A sample from a log file shown below.

```
2020/10/21 00:22:33 Host IP address: 169.254.100.4
2020/10/21 00:22:33 Client IP address: 169.254.100.1
2020/10/21 00:22:33 Modbus address: 1
2020/10/21 00:22:33 Reg. assignment: STD Modbus
```

Time stamp: relative

9.5 Calibration

The Calibration menu is reserved for factory use and for use in the laboratory of the authority calibrating the flow computer. It is accessible with special password only.

9.5.1 Rosemount 3095 calibration

If Rosemount 3095 multivariable transmitter with Modbus protocol is connected to Uniflow-200 on one of the serial link and the measured parameters (differential pressure, pressure, temperature) are assigned to one of the metering streams, then the calibration of this transmitter can be initiated here.

After entering the engineering level password the transmitter calibration display appears:

Route in the menu tree: Calibration

Function of the F keys on the Calibration data page

select the next field for editing

select the previous field for editing

- Change modify the selected data field
- **OK** Confirm the selection

Menu returns to the parent menu

Transm. calibration Stream selection Sensors to calibrate	1
DP diff.pressure	yes
Keypad value	500 mbar
SP static pressure	yes
Keypad value	55 bar
PT temperature	yes
Keypad value	12 °C
Start calibration	yes
OK Change	

Figure 9-179 Transmitter calibration display

Select the stream in which the signals measured by the transmitter are used.

Select the sensors to be calibrated (DP, SP, PT) and enter the Keypad values. Keypad values will be used in the flow calculation during the calibration. Enter 0 keypad value for DP to stop the flow calculation during the calibration.

Change Start calibration field to yes and press OK.

Message box appears on the display requiring that the Write protection jumper to be set to OFF position. With jumper in ON position Uniflow-200 will not start the calibration. If the jumper is in OFF position then the sensor calibration page appears on display.

Sensor calibration		
Stream selection	1	
Sensor selection	DP	
L0_scale	0	mbar
HI_scale	1000	mbar
damping	1.5	sec
Sensor calibration	no	
Reset to factory trim	no	
Change		î

Figure 9-180 Sensor calibration display

Select the sensor (DP, SP, PT) to be calibrated. The LO scale, HI scale value for the selected sensor will be displayed as defined in the Modbus signal definition section. If you modify the LO scale or HI scale value here, the modified values will be written to the Modbus signal parameters. The damping parameter value is read from the transmitter.

There is an option "Reset to factory trim" on the display, allowing to restore the sensor offset (zero) and slope (span) value to the factory default value.

To calibrate the selected sensor set the Sensor calibration command to yes and press OK. Message box appears requiring to apply LO scale value signal to sensor. The measured value of the signal is displayed in the message box.

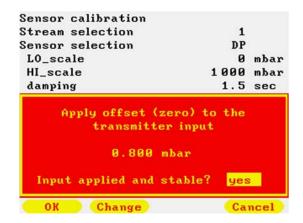

Figure 9-181 DP sensor offset calibration display

When the signal is applied and the reading is stable press OK. New message box appears confirming the successful setting of the transmitter offset.

9.6 Help

The contact details of the manufacturer (phone, fax, email address, website address) are available on this page.

9.7 Language/Nyelv/Язык/Limba

Route in the menu tree: Main Language/Nyelv/Язык/Limba

Function of the F keys on the Language change data page

Change Modify the language

OK Confirm the selection

Menu Returns to the parent menu

This menu item is to change the working language of the flow computer. Highlighting the menu item and pressing key \Rightarrow language change display opens.

Language changed	
Language	Русский
OK Change	Menu

Figure 9-189 Language change display

Available languages are:

- English;
- Hungarian (Magyar);
- Russian (Русский)
- o Român (Romanian)

After selecting the appropriate language and confirming the selection the flow computer completely changes the working language.

The language change will change to the appropriate language:

- display text;
- entries in the alarm and event log and archive records;
- text on the reports;

Changing the working language will not affect the operation of the flow computer. The setup made in one language remains valid after the other display language is selected.

CAUTION

The records made in the alarm and event log and in the archive record files before the changing of the language will not be changed to other language.

However, all the subsequent records will be done on the language activated.

It is recommended to make a general reset after the changing of the language setting. It will ensure to have single language records in the log files.

10 Communication

UNIFLOW-200 equipped with one 100 MHz Ethernet port and maximum of 8 serial communication ports (Com1 to Com8) allowing integration of the flow computer into data acquisition systems.

Port Com1 is on the CPU board, it always present.

Port Com2 and Com3 exists if SE serial extension module is installed.

Port Com4 to Com8 exists if CX5 serial extension board is installed.

UNIFLOW-200 is the slave device in the communication. It means that UNIFLOW-200 can be gueried for data and it will respond if the queried registers are defined. Metering data can be read from UNIFLOW-200 flow computer via standard RS232, RS485, RS422 serial link and via 10/100 Ethernet link.

Communication protocols implemented:

Com1 to Com8 ports:	MODBUS over serial port
Ethernet port:	MODBUS over TCP

Modbus function codes implemented:

- 3 (0x03) read multiply registers
- 16 (0x10) write multiply registers

Port function of the serial port can be set to:

•	STD Modbus slave RTU	(2 bytes/register)
•	STD Modbus slave ASCII	(2 bytes/register)
٠	Daniel slave RTU	(4 bytes/register)
•	Daniel slave ASCII	(4 bytes/register)

Port function for the serial port shall be set to STD Modbus slave to be able to read data listed in point 10.5 (including 10.5.1., 10.5.2. and 10.5.3.) in standard Modbus format.

Port function for the serial port shall be set to Daniel Modbus slave to be able to read data listed in point 10.6 (including 10.6.1., 10.6.2. and 10.6.3.) in Daniel/Omni/Enron Modbus format.

Register assignment for Ethernet port shall be set to STD MODBUS to be able to read data listed in point 10.5 (including 10.5.1., 10.5.2, and 10.5.3.) in standard Modbus format.

Register assignment for Ethernet port shall be set to Daniel to be able to read data listed in point 10.6 (including 10.6.1., 10.6.2. and 10.6.3.) in Daniel/Omni/Enron Modbus format.

Port function on any serial or Ethernet port can be set to User Modbus. In this case data defined in the User Modbus table can be accessed via port. See details of the User Modbus in Annex C.

Special functions implemented for polling ultrasonic flow meters:

Caldon US master

•

- (for Caldon ultrasonic meters) • Daniel US master (for Daniel ultrasonic meters)
- Flexim US master (for Flexim ultrasonic meters) •
- (for Sick-Maihak Flowsic-600 ultrasonic meter) Flowsic-600 master
- Flowsic-600XT master (for Sick-Maihak Flowsic-600XT ultrasonic meter)
 - (for Khrone ultrasonic meters)
- Khrone US master
- Panam US master (for Panametrics ultrasonic meters)
 - QSonic US Uniform (for Instromet ultrasonic meters with Uniform protocol)

(for RMG ultrasonic meters)

- QSonicPlus US master (for Instromet ultrasonic meters with Modbus protocol)
- RMA US master (for RMA ultrasonic meters)
- RMG US master
- Siemens US master (for Siemens ultrasonic meters)
- FMC MPU Series B (for FMC ultrasonic meters)

In this special functions not only the flow information (flow rate and/or gas velocity) but the diagnostic information is read from the meters as well.

Special functions implemented for polling gas chromatographs:

- ABB GC master (for ABB GC)
 - ABB2 GC master (for ABB GC)
 - Daniel C6+ GC master (for Daniel C6+ GC)
 - Daniel C9+ GC master (for Daniel C9+ GC)

- Yamatake GC master (for Yamatake GC)
- Yokogawa GC master (for Yokogawa GC)
- EnCal3000 GC master (for Elster Encal300 GC)

If one of the com ports is configured for chromatograph polling then UNIFLOW-200 will read the natural gas composition from the gas chromatograph and the gas composition will be used in the gas properties calculation. See 9.2.2.1.1.1. and 9.2.4.1.

The serial ports and the USB port can be used as printer port to transfer the archive data to external device (file dumping to serial printer, serial port of PC or USB flash drive). See details in 9.1.5.

The archive data files sent to the serial or USB port make use of UTF8 encoding. To display the archive data file on external device it shall be set accordingly. Otherwise, some of the characters on the reports might not be displayed properly.

10.1 Serial link setup

The parameters of the serial link are setup in the Parameters/Interfaces/Com ports menu.

After selecting the port to be configured the type (RS232, RS485, RS422) is set together with the data flow parameters (data bits, stop bits, parity, etc.). Then the mode of communication is selected (STD Modbus, Daniel Modbus or User Modbus, RTU or ASCII). Finally, the device address shall be set.

If the port type RS485 or RS422MD is set then the response delay can also be set. The default value is 1 ms which is suitable in most of the case but can be modified if required.

In case of RS232 and RS422PP port type the response, delay cannot be set.

10.2 Ethernet link setup

The parameters of the Ethernet link are setup in the Parameters/Interfaces/Ethernet menu.

The IP address, the subnet mask and the default gateway should be set together with the Modbus device address.

The register mode can be set to STD Modbus, Daniel Modbus or User Modbus.

The protocol implemented is MODBUS over TCP.

The flow computer is capable to act as DHCP server if configured so.

10.3 Communication device address

If Daniel Modbus slave RTU or Daniel Modbus slave ASCII mode is selected then there are two ways to read the metering data from the flow computer for all 12 metering streams (8 physical and 4 virtual streams).

All data for all streams can be read on the base device address set in the com port setup menu.

At the same time all metering stream have its own device address and the metering data for a particular stream can be read on this particular device address.

	-	the base device dress		Registers on the stream device address		
Stream	Totals (4 bytes integer)	Other data (4 bytes float)	Stream device address	Totals (4 bytes integer)	Other data (4 bytes float)	
1	5001 - 5148	7001 - 7099	base device address	5001 - 5148	7001 - 7099	
2	5201 - 5348	7101 - 7199	base device address + 1	5001 - 5148	7001 - 7099	
3	5401 - 5548	7201 - 7299	base device address + 2	5001 - 5148	7001 - 7099	
4	5601 - 5748	7301 - 7399	base device address + 3	5001 - 5148	7001 - 7099	
5	5801 - 5948	7401 - 7499	base device address + 4	5001 - 5148	7001 - 7099	
6	6001 - 6148	7501 - 7599	base device address + 5	5001 - 5148	7001 - 7099	
7	6201 - 6348	7601 - 7699	base device address + 6	5001 - 5148	7001 - 7099	

The register address ranges and the device addresses are shown in the table below.

8	6401 - 6548	7701 - 7799	base device address + 7	5001 - 5148	7001 - 7099
9	9001 - 9148	8001 - 8099	base device address + 8	5001 - 5148	7001 - 7099
10	9201 - 9348	8101 - 8199	base device address + 9	5001 - 5148	7001 - 7099
11	9401 - 9548	8201 - 8299	base device address + 10	5001 - 5148	7001 - 7099
12	9601 - 9748	8301 - 8399	base device address + 11	5001 - 5148	7001 - 7099

Table 10-16 Communication device addresses

NOTE

In Daniel Modbus slave mode one UNIFLOW-200 occupies 12 consecutive device addresses. If other devices connected to the serial link (e.g. on RS485 bus) the setting of the device addresses should take it into consideration.

10.4 Protocol implementation

10.4.1 Implemented Modbus command codes

10.4.1.1 Read multiply registers (code: 3)

Query:								
А	F	RAH	RAL	RNH	RNL	СН	CL	
		·					•	
Respons	e.							

A I	F	BN	D1		Dn	СН	CL		

10.4.1.2 Write multiply registers (code: 16)

Query:									
А	F	RAH	RAL	RNH	RNL	BN	D1	 СН	CL
Resnons	20'								

1.000									
А	F	RAH	RAL	RNH	RNL	СН	CL		

where:

А	- device address
F	- function code
RAH, RAL	- starting register address, in high byte, low byte order
RNH, RNL	 number of registers, in high byte, low byte order
BN	- number of bytes (from 0 to 255)
D1 Dn	 data bytes, n = 2 * number of registers
CH, CL	 CRC check sum, in high byte, low byte order

Examples

Read stream 6 instantaneous flow data and alarm registers (18 registers) from the flow computer with device address 17 (0x11)

Query

	device address	function code	starting register	starting register (low	number of register	number of register (low	checksum (2 bytes)
			(high byte)	byte)	(high byte)	byte)	
ſ	0x11	0x03	0x01	0x2c	0x00	0x12	CRC

Response

device	function	number of bytes	data bytes	checksum (2
address	code		(36 bytes)	bytes)
0x11	0x03	0x30		CRC

Write zero to the first 4 gas component concentration register

Query

device address	function code	starting register (high byte)	starting register (low byte)	number of register (high byte)	number of register (low byte)	byte count (1 byte)	data (16 bytes)	checksum (2 bytes)
0x11	0x10	0x03	0x32	0x00	0x08	0x10		CRC

Response

	device address	function code	starting register (high byte)	starting register (low byte)	number of register (high byte)	number of register (low byte)	checksum (2 bytes)
	0x11	0x10	0x03	0x32	0x00	0x08	CRC

10.4.2 Calculation of CRC check sum

The polynomial value used in CRC calculation is 0xa001.

CRC is calculated in steps as follows:

- 1. Load a 16-bit register with 0xfff hex (all 1's). Call this the CRC register.
- 2. Exclusive OR the first 8-bit byte of the message with the high-order byte of the 16-bit CRC register, putting the result in the CRC register.
- 3. Shift the CRC register one bit to the right (toward the LSB), zero–filling the MSB. Extract and examine the LSB.
- 4 (If the LSB was 0): Repeat Step 3 (another shift).
- 5. (If the LSB was 1): Exclusive OR the CRC register with the polynomial value A001 hex (1010 0000 0000 0001).
- 6. Repeat Steps 3 and 4 until 8 shifts have been performed. When this is done, a complete 8–bit byte will have been processed.
- 7. Repeat the steps 2 to 6 with the next byte of the message until all the bytes are processed.
- 8. The result is the CRC of the message.

10.4.3 Data types in the Modbus registers

10.4.3.1 8 bit binary unsigned integer

They are stored in the low order or high order byte of the Modbus registers. Range: from 0 to 255 (0x00 to 0xff) Data stored in this form are the parts of the date for example. In some cases bits of this data type have separate interpretation for example in alarm registers.

10.4.3.2 16 bit binary unsigned integer

They are stored in the Modbus registers. Range: from 0 to 65535 (0x0000 to 0xfff)

10.4.3.3 32 bit binary signed integer

They are stored in two Modbus registers.

Range: from -2 147 483 648 to 2 147 483 648 (0x0000 to 0x7fffffff positive numbers and 0x80000000 to 0xffffffff negative numbers)

Numbers are stored as follows:

31	31 30			0	
S	S absolute value of the number				
High	byte	Low byte + 2	Low byte + 1	Low byte	
low c	order Modbus register		high order Modbus reg	high order Modbus register	

The S sign bit is 0 if the number is positive and 1 if the number is negative.

As far as number is stored not in 2's complements form both +0 and -0 are valid.

10.4.3.4 Floating point number

Most of the data are stored in floating point format.

The format used in the flow computer for floating point number is equivalent to the IEEE 754/1985 Short real (single precision) format.

Numbers are stored in three parts: sign, exponent and mantissa on four bytes. Floating point numbers are stored in two Modbus registers.

Range: +/-(8.43*10⁻³⁷ ... 3.4*10⁻³⁸), and the numbers are accurate up to 7 decimal digits.

Numbers	are	stored	as	follows:
NULLIDELS	are	310160	as	10110103.

31	30 23	22		0
S	Exponent	Mantissa		
High	byte	Low byte	High byte	Low byte
High	order Modbus register		Low order Modbus register	

The S sign bit is 0 if the number is positive and 1 if the number is negative.

As far as number is stored not in 2's complements form both +0 and -0 are valid.

-0 is not interpreted as number. It is used for special purposes in the flow computer.

Mantissa is stored in normalized form without the most significant bit which is always 1. It means that the 22nd bit is 2^{-1} , the 21st bit is 2^{-2} and the 0. bit is 2^{-23}

The exponent filed holds the exponent value biased by 127. The bias provides that the exponent field is always positive. The range of the exponent is from -126 to +127.

Floating point number = (-1)*S*(1+bit22*2-1+bit21*2-2+...+bit0*2-23)*2Exponent-127

10.5 Standard Modbus register map (2 byte/register)

General purpose register block, total length 120 Modbus registers

4000	ReadWrite	1. variable	(32 bit float)	2+2 reg./variable
4002	ReadWrite	2. variable	• •	
4058	ReadWrite	30. variable		
4060	ReadWrite	1. variable timeout counter register *		
4062	ReadWrite	2. variable timeout counter register *		
4118	ReadWrite	3. variable timeout counter register *		

* When the timeout counter value of any particular Modbus signal exceeds the update timeout of that signal it causes an update timeout alarm. In this alarm condition if the Modbus signal is flow signal it will be substituted with zero (0), i.e. zero flow is assumed. If the Modbus signal is not flow signal it will be substituted with its keypad value in the subsequent calculations. Register update of a variable automatically clears its own timeout counter register to zero.

3-4	concentration m/m %	2 reg.

10.5.1 Accessing periodic totals

UNIFLOW-200 supports the reading of the periodic totals in one message for each stream separately in this register mode. All the periodic totals (120 registers) must be read in one message. Reading part of the totals is not supported.

The starting address of the periodic totals for stream n. calculated as follows:

Starting address = 20 000 + 256 * (stream number – 1)

The total length of the data bytes in the response is 240 bytes (60 totals in floating point format, i.e. 120 Modbus registers).

6-7	volume at base conditions (CVOL),	
	previous month	
10-11	volume at base conditions (CVOL),	
	current hour	
12-13	volume at base conditions (CVOL),	
	current 8 hour	
14-15	volume at base conditions (CVOL),	
	current day	
16-17	volume at base conditions (CVOL),	
	current month	
20-21	mass, previous hour	
22-23	mass, previous 8 hour	
24-25	mass, previous day	
26-27	mass, previous month	
30-31	mass, current hour	
32-33	mass, current 8 hour	
34-35	mass, current day	
36-37	mass, current month	
40-41	energy, previous hour	
42-43	energy, previous 8 hour	
44-45	energy, previous day	
46-47	energy, previous month	
50-51	energy, current hour	
52-53	energy, current 8 hour	
54-55	energy, current day	
56-57	energy, current month	
60-61	premium volume at base conditions	
	(CVOL), previous hour	
62-63	premium volume at base conditions	
	(CVOL), previous 8 hour	

64-65	premium volume at base conditions	
	(CVOL), previous day	
66-67	premium volume at base conditions	
	(CVOL), previous month	
70-71	premium volume at base conditions	
	(CVOL), current hour	
72-73	premium volume at base conditions	
	(CVOL), current 8 hour	
74-75	premium volume at base conditions	
	(CVOL), current day	
76-77	premium volume at base conditions	
	(CVOL), current month	
80-81	premium mass, previous hour	
82-83	premium mass, previous 8 hour	
84-85	premium mass, previous day	
86-87	premium mass, previous month	
90-91	premium mass, current hour	
92-93	premium mass, current 8 hour	
94-95	premium mass, current day	
96-97	premium mass, current month	
100-101	premium energy, previous hour	
102-103	premium energy, previous 8 hour	
104-105	premium energy, previous day	
106-107	premium energy, previous month	
110-111	premium energy, current hour	
112-113	premium energy, current 8 hour	
114-115	premium energy, current day	
116-117	premium energy, current month	

Unit of measurement for the quantities listed in tables above:

	METRIC UNIT	IMPERIAL UNIT (only in case of natural gas measuring)
mass	kg (t)*	lb
mass flowrate	kg/h (t/h)*	lb/h
volume	m3 (I)*	MCF
volume flowrate	m3/h (l/h)*	MCF/h
energy	GJ (MJ, MWh, kWh)*	MMBTU
energy flowrate	GJ/h (MJ/h, MW, kW)*	MMBTU/h
pressure	bar (absolute)	PSIA
temperature	°C	°F
density	kg/m3	lb/CF
gas components	mole %	mole%
time	seconds second	S

* depending on the settings in the flow computer

10.5.2 Accessing batch data

10.5.2.1 Accessing batch data in case of "Tank loading/unloading" batch

Addresses of Modbus registers related to batch measurement are listed in the table below. See also 9.1.7.

Modbus Reg. type Description register	Note
---------------------------------------	------

9000	Read/Write	Register block for batch start/stop on stream 1.	40 registers/stream
	Read/Write		
9280	Read/Write	Register block for batch start/stop on stream 8.	

Offset	Batch parameters	Description
0	Batch start/stop	Integer, 1 – start batch, 0 – stop batch
		(1 reg.)
1	Copy of printed reports	Integer, (0,1,2,3 copy) (1 reg.)
2-21	Tank car route (from/to)	40 x ASCII character (20 reg.)
22-26	Number plate of the car	10 x ASCII character (5 reg.)
27	Reserved	(1 reg.)
28-29	Batch required quantity	floating point number (2 reg.)
30-39	Reserved	(10 reg.)

9320	ReadOnly	Register block for measured batch quantities on stream 1 (ongoing batch data if batch is in progress, last batch data if batch is not in progress)	
	ReadOnly		
9740	ReadOnly	Register block for measured batch quantities on stream 8 (ongoing batch data if batch is in progress, last batch data if batch is not in progress)	

Offset	Batch quantities	Description			
0	Batch status	Integer, 1 – in progress, 0 – finished			
		(1 reg.)			
1-5	Loading station (stream name)	10 x ASCII o	10 x ASCII character (5 reg.)		
6-25	Tank car route (from/to)	40 x ASCII o	character	(20 reg.)	
26-30	Number plate of the car	10 x ASCII o	character	(5 reg.)	
31	Batch start time	Year (H)	Month (L)	Integer	
32		Day (H)	Hour (L)		
33		Minute (H)	Second (L)	(3 reg.)	
34	Batch stop time	Year (H)	Month (L)	Integer	
35		Day (H)	Hour (L)		
36		Minute(H) Second (L)		(3 reg.)	
37	Reserved			(1 reg)	
38-39	Batch mass	(see Note 1)		(2 reg.)	
40-41	Batch volume at base condition			(2 reg.)	
42-43	Batch average base density [kg/m ³]	floating poin	t number	(2 reg.)	
44-45	Batch average temperature [°C]	floating poin	t number	(2 reg.)	
46-47	Batch average line density [kg/m ³]	floating poin	t number	(2 reg.)	
48-49	Batch average concentration %(m/m)	floating poin	t number	(2 reg.)	
50-51	Batch average measured density [kg/m ³]			(2 reg.)	
52-53	Batch average absolute pressure [bar]			(2 reg.)	
54-55	Batch average gauge pressure [bar]			(2 reg.)	
56-57	Batch volume at line conditions	(see Note 1) (2 reg.)			
58-59	Batch average concentration %(v/v)	floating point number (2 reg.)			
Note 1					
The number format is determined by the settings of the Totals format parameter (see 9.2.2.7)					

10.5.2.2 Accessing batch data in case of "Pipeline product interface" batch

Addresses of Modbus registers related to batch measurement are listed in the table below.	
See also 9.1.7.	

Modbus register	Reg. type	Description	Note

90	000	Read/Write	Register block for batch start/stop on stream 1.	40 registers/stream
		Read/Write		
92	280	Read/Write	Register block for batch start/stop on stream 8.	

Offset	Batch parameters	Description	
0	Batch start/stop	Integer, 1 – start batch, 0 –	stop batch
			(1 reg.)
1	Batch identifier	Integer	(1 reg.)
2	Batch product code	integer	(1 reg.)
3	Batch product name	10 x ASCII character	(5 reg.)
8-38	Reserved		(31 reg.)
39	Reserved		(0 reg.)

9320	ReadOnly	Register block for measured batch quantities on stream 1 (ongoing batch data if batch is in progress, last batch data if batch is not in progress).	60 registers/stream
	ReadOnly		
9740	ReadOnly	Register block for measured batch quantities on stream 8 (ongoing batch data if batch is in progress, last batch data if batch is not in progress)	

Offset	Batch quantities	Description	
0	Batch status	Integer, 1 – in progress, 0 – finished	
		(1 reg.	.)
1	Batch identifier	Integer (1 reg.	.)
2	Batch product code	Integer (1 reg.	.)
3-7	Batch product name	10 x ASCII character (5 reg.	.)
8-12	Loading station (stream name)	10 x ASCII character (5 reg.	.)
13-22	Batch start time (yyyy-mm-dd hh:mm:ss)	20 x ASCII character (10 reg.	.)
23-32	Batch stop time (yyyy-mm-dd hh:mm:ss)	20 x ASCII character (10 reg.	.)
33	Reserved	(0 reg	.)
34-35	Batch average absolute pressure [bar]	floating point number (2 reg.	.)
36-37	Batch average temperature [°C]	floating point number (2 reg.	.)
38-39	Batch average base density [kg/m ³]	floating point number (2 reg.	.)
40-41	Batch volume at base condition	floating point number (2 reg.	.)
42-43	Batch volume at line conditions	floating point number (2 reg.	.)
44-45	Batch mass	floating point number (2 reg.	.)
46-47	Batch average gauge pressure [bar]	floating point number (2 reg.	.)
48-49	Batch average line density [kg/m ³]	floating point number (2 reg.	.)
50-59	Reserved	(5 reg	.)

10000	ReadOnly	Register block for the last finished batch quantities on	180 registers/stream
		stream 1.	
10060	ReadOnly	Register block for the second last finished batch quantities on stream 1.	
10120	ReadOnly	Register block for the third last finished batch quantities on stream 1.	
11260	ReadOnly	Register block for the last finished batch quantities on stream 8.	
11320	ReadOnly	Register block for the second last finished batch quantities on stream 8.	

11380	ReadOnly	Register block for the third last finished batch quantities	
		on stream 8.	

Offset	Batch quantities	Description	
0	Batch status	Integer, 1 – in progress, 0 – fini	shed
			(1 reg.)
1	Batch identifier	Integer	(1 reg.)
2	Batch product code	Integer	(1 reg.)
3-7	Batch product name	10 x ASCII character	(5 reg.)
8-12	Loading station (stream name)	10 x ASCII character	(5 reg.)
13-22	Batch start time (yyyy-mm-dd hh:mm:ss)	20 x ASCII character	(10 reg.)
23-32	Batch stop time (yyyy-mm-dd hh:mm:ss)	20 x ASCII character	(10 reg.)
33	Reserved		(0 reg.)
34-35	Batch average absolute pressure [bar]	floating point number	(2 reg.)
36-37	Batch average temperature [°C]	floating point number	(2 reg.)
38-39	Batch average base density [kg/m3]	floating point number	(2 reg.)
40-41	Batch volume at base condition	floating point number	(2 reg.)
42-43	Batch volume at line conditions	floating point number	(2 reg.)
44-45	Batch mass	floating point number	(2 reg.)
46-47	Batch average gauge pressure [bar]	floating point number	(2 reg.)
48-49	Batch average line density [kg/m3]	floating point number	(2 reg.)
50-59	Reserved		(5 reg.)

10.5.3 Accessing flow meter serial test data

Addresses of Modbus registers related to meter serial test measurement are listed in the table below. See also 9.1.8. Flow meter serial test data are available via link (Ethernet or serial) set to Daniel Modbus register assignment.

MASTER/ SLAVE registers (2 byte) read only	SLAVE registers (2 byte) read/write to control serial test	MASTER registers (2 byte) read/write to control serial test from upper level (DCS)	Description	Unit of measurement	Data format / Note
20		2600	Function 1 – custody transfer measurement 2 – non custody transfer measurement		
21		2601	not used		
22		2602	not used		
23	2051	2603	Duration of the test	minute	16 bit unsigned integer
24	2052	2604	Start command = 0, idle = 1, start	-	16 bit unsigned integer
25	2053	2605	Stop command = 0, idle = 1, stop (finish test) = 2, abort (abort test)	-	16 bit unsigned integer
26		2606	Serial test status = 0, idle = 1, starting = 2, running = 3, data processing = 4, ready	-	16 bit unsigned integer
27		2607	Elapsed time	minute	16 bit unsigned integer

28	2608	Cycle counter	-	16 bit unsigned integer
29	2609	not used		
30		not used		
31-48		Stream name	-	ASCII string – read only
49		Stream serial number (1 to 8)	-	16 bit unsigned integer
50		serial test start Month Year	-	16 bit unsigned integer
51		serial test start Hour Day	-	16 bit unsigned integer
52		serial test start Second Minute	-	16 bit unsigned integer
53		not used		
54		serial test stop Month Year	-	16 bit unsigned integer
55		serial test stop Hour Day	-	16 bit unsigned integer
56		serial test stop Second Minute	-	16 bit unsigned integer
57		not used		
58		serial test volume at line conditions	m3	32 bit float
60		serial test volume at line conditions converted to the pressure and temperature in the master line	m3	32 bit float
62		serial test volume at base conditions	m3	32 bit float
64		serial test mass	kg	32 bit float
66		serial test energy	GJ	32 bit float
68		serial test average pressure	barA	32 bit float
70		serial test average temperature	°C	32 bit float
72		serial test average compression factor at line conditions	-	32 bit float
74		serial test average compression factor at base conditions	-	32 bit float
76		serial test average volume flow rate at line conditions	m3/h	32 bit float
78		serial test average volume flow rate at line conditions converted to the pressure and temperature in the master line	m3/h	32 bit float
80		serial test average volume flow rate at base conditions	m3/h	32 bit float
82		serial test average mass flow rate	kg/h	32 bit float
84		serial test average energy flow rate	GJ/h	32 bit float
86		serial test average relative density	-	32 bit float
88		serial test average base density	kg/m3	32 bit float
90		serial test average line density	kg/m3	32 bit float
92		serial test average relative density converted to the pressure and temperature in the master line	kg/m3	32 bit float
94		serial test average inferior heating value	MJ/m3	32 bit float
96		serial test average superior heating value	MJ/m3	32 bit float

98	serial test average differential pressure	mbar	32 bit float
100	serial test average nitrogen	mole%	32 bit float
102	serial test average carbon-dioxide	mole%	32 bit float
104	serial test average H2S	mole%	32 bit float
106	serial test average H2O	mole%	32 bit float
108	serial test average helium	mole%	32 bit float
110	serial test average methane	mole%	32 bit float
112	serial test average ethane	mole%	32 bit float
114	serial test average propane	mole%	32 bit float
116	serial test average n-butane	mole%	32 bit float
118	serial test average i-butane	mole%	32 bit float
120	serial test average n-pentane	mole%	32 bit float
122	serial test average i-pentane	mole%	32 bit float
124	serial test average hexane	mole%	32 bit float
126	serial test average heptane	mole%	32 bit float
128	serial test average octane	mole%	32 bit float
130	serial test average nonane	mole%	32 bit float
132	serial test average decane	mole%	32 bit float
134	serial test average oxygen	mole%	32 bit float
136	serial test average carbon-monoxide	mole%	32 bit float
138	serial test average hydrogen	mole%	32 bit float
140	serial test average argon	mole%	32 bit float
142	serial test average total moles	mole%	32 bit float

Note: batch data and serial test data are available in metric units only.

10.6 Daniel Modbus register map (4 byte/register)

10.6.1 Registers for system date and time modification via Modbus link

Register	Data type	Description
address		
1	16 bit integer	Downloaded Year (4 digits) (19002999)
2	16 bit integer	Downloaded Month (112)
3	16 bit integer	Downloaded Day (131)
4	16 bit integer	Downloaded Hour (023)
5	16 bit integer	Downloaded Minute (059)
6	16 bit integer	Downloaded Second (059
7	16 bit integer	Accept time
	-	Write 1 to this register to accept the downloaded date and time and set it as
		current date and time.
		After accepting the time flow computer writes it to 0.
8 10	16 bit integer	n/a
11	16 bit integer	System clock Year (4 digits)
12	16 bit integer	System clock Month
13	16 bit integer	System clock Day
14	16 bit integer	System clock Hour
15	16 bit integer	System clock Minute
16	16 bit integer	System clock Second
17 20	16 bit integer	n/a

Modify the time in steps:

- 1. Write the desired new date and time into registers 1 to 6.
- 2. Write 1 to register 7. Writing register 7 to 1 can be done in one message together with the date and time writing.
- 3. UNIFLOW-200 accepts the new date and time and writes register 7 back to 0.

10.6.2 Registers for totals

Register address	Data type	Description
5001	32 bit integer	Current hour volume at base conditions (CVOL)
5002	32 bit integer	Current day volume at base conditions (CVOL)
5003	32 bit integer	Current multiday volume at base conditions (CVOL)
5004	32 bit integer	Current month volume at base conditions (CVOL)
5005	32 bit integer	Previous hour volume at base conditions (CVOL)
5006	32 bit integer	Previous day volume at base conditions (CVOL)
5007	32 bit integer	Previous multiday volume at base conditions (CVOL)
5008	32 bit integer	Previous month volume at base conditions (CVOL)
5009	32 bit integer	Volume at base conditions (CVOL) cumulative total
5010	32 bit integer	n/a
5011	32 bit integer	Current hour carbon mass
5012	32 bit integer	Current day carbon mass
5013	32 bit integer	Current multiday carbon mass
5014	32 bit integer	Current month carbon mass
5015	32 bit integer	Previous hour carbon mass
5016	32 bit integer	Previous day carbon mass
5017	32 bit integer	Previous multiday carbon mass
5018	32 bit integer	Previous month carbon mass
5019	32 bit integer	Carbon mass cumulative total
5020	32 bit integer	n/a
5021	32 bit integer	Current hour energy
5022	32 bit integer	Current day energy
5023	32 bit integer	Current multiday energy

10.6.3 Registers for other measured data

Register address	Data type	Description			
7001	32 bit floating	Downloaded Nitrogen			
7001	32 bit floating	Downloaded Carbon-dioxide			
7002	32 bit floating	Downloaded Hydrogen-sulfide			
7004	32 bit floating	Downloaded Water			
7005	32 bit floating	Downloaded Helium			
7006	32 bit floating	Downloaded Methane			
7007	32 bit floating	Downloaded Ethane			
7008	32 bit floating	Downloaded Propane			
7009	32 bit floating	Downloaded n-Butane			
7010	32 bit floating	Downloaded i-Butane			
7011	32 bit floating	Downloaded n-Pentane			
7012	32 bit floating	Downloaded i-Pentane			
7013	32 bit floating	Downloaded n-Hexane			
7014	32 bit floating	Downloaded n-Heptane			
7015	32 bit floating	Downloaded n-Octane			
7016	32 bit floating	Downloaded n-Nonane			
7017	32 bit floating	Downloaded n-Decane			
7018	32 bit floating	Downloaded Oxygen			
7019	32 bit floating	Downloaded Carbon-monoxide			
7020	32 bit floating	Downloaded Hydrogen			
7021	32 bit floating	Downloaded Relative density			
7022	32 bit floating	Downloaded Inferior calorific value			
7023	32 bit floating	Downloaded Superior calorific value			
7024	32 bit floating	Downloaded argon			
7025	32 bit floating	Line density			
7026	32 bit floating	Base density			
7027	32 bit floating	Specific carbon content			
7028	32 bit floating	n/a			
7029	32 bit floating	n/a			
7030	32 bit floating	Downloaded Ethylene			
7031	32 bit floating	Fluid pressure, absolute			
7032	32 bit floating	Fluid temperature			
7033	32 bit floating	Differential pressure			

7034	32 bit floating	Volume at base conditions (CVOL) flowrate		
7035	32 bit floating	Energy flowrate		
7036	32 bit floating	Volume at line conditions (UVOL) flowrate		
7037	32 bit floating	n/a		
7038	32 bit floating	n/a		
7039	32 bit floating	Carbon mass flowrate		
7040	32 bit floating	n/a		
7041	32 bit floating	Current day average pressure, absolute		
7042	32 bit floating	Current day average temperature		
7043	32 bit floating	Current day average compression factor (K=Zline/Zbase), -		
7044	32 bit floating	Previous day average pressure, absolute		
7045	32 bit floating	Previous day average temperature		
7046	32 bit floating	Previous day average compression factor (K=Zline/Zbase), -		
7047	32 bit floating	Current month average pressure, absolute		
7048	32 bit floating	Current month average temperature		
7049	32 bit floating	Current month average compression factor (K=Zline/Zbase), -		
7050	32 bit floating	Previous month average pressure, absolute		
7051	32 bit floating	Previous month average temperature		
7052	32 bit floating	Previous month average compression factor (K=Zline/Zbase), -		
7053	32 bit floating	n/a		
7054	32 bit floating	n/a		
7055	32 bit floating	Pressure measured at IO channel		
7056	32 bit floating	Differential pressure (dP low) measured at IO channel		
7057	32 bit floating	Differential pressure (dP medium) measured at IO channel		
7058	32 bit floating	Differential pressure (dP high) measured at IO channel		
7059	32 bit floating	Temperature measured at 4-20 mA IO channel		
7060	32 bit floating	n/a		
7061	32 bit floating	Relative density measured at IO channel		
7062	32 bit floating	CO2 content measured at IO channel, mole%		
7063	32 bit floating	N2 content measured at IO channel, mole%		
7064	32 bit floating	Inferior calorific value measured at IO channel		
7065	32 bit floating	Temperature measured at Pt100 IO channel		
7066	32 bit floating	n/a		
7067	32 bit floating	Linear gas velocity		
7068	32 bit floating	n/a		
7069	32 bit floating	n/a		
7070	32 bit floating	n/a		
7071	32 bit floating	Current hour fault time, hour		
7072	32 bit floating	Current day fault time, hour		
7073	32 bit floating	Current multiday fault time, hour

* depending on the settings in the flow computer

10.7 Register maps of the Modbus Slave devices

Uniflow-200 is capable to communicate with different Modbus Slave devices (gas chromatographs, ultrasonic meters, mass flow meters). The Modbus registers read from these Modbus Slave devices are described below. In case of difficulties in establishing communication with Modbus Slave devices it is recommended to check if the registers in the Modbus Slave device are mapped as listed in the Tables below.

Register address	Data type	Description	Unit	Remark
5000	float32	Volume flow rate at line conditions	m3/h

30062	byte4	Long Status Sensor				
30064	byte4	Long Status Device				

NOTE:

- Unit of volume flow must be set to m3/h and the unit of mass flow must be set to kg/h.

- Mass flow, density and temperature are assigned to internal Modbus registers of the flow computer. These Modbus registers then shall be configured as Modbus signals and can be utilized in stream setup as

input signals for flow calculation.

- Units of Counters 1, 2, 3 are depending on the settings in FMC300.

NOTE: Mass flow, density, pressure and temperature are assigned to internal Modbus registers of the flow computer. These Modbus registers then shall be configured as Modbus signals and can be utilized in stream setup as input signals for flow calculation.

Annex A. Reports

Archive reports naming conventions

The archive report files can be transferred from the UNIFLOW-200 to external device in two ways.

- reports are transferred to serial or USB ports from the menu Flow > Data transfer.
 - reports are read by UNIArchive program.

The naming convention for the reports and report file names is as follows.

Content of the report	Report name on the Flow - > Data transfer menu	File name in UNIArchive
Limited set of daily data for the current month	Month (daily short) (month shall be selected in	<i>nn</i> str_ <i>streamname_yyyy_mm_dd_</i> daily.txt Example: 01str_M123_2013_04_12_daily.txt
Limited set of daily data for the previous months	separate field, previous 12 month data are available for selection)	<i>nn</i> str_ <i>streamname_yyyy_mm</i> _daily.txt Example: 01str_M123_2013_03_daily.txt
Limited set of hourly data for the current month	Month (hourly short) (month shall be selected in	<i>nn</i> str_ <i>streamname_yyyy_mm_dd</i> _hourly.txt Example: 01str_M123_2013_04_12_hourly.txt
Limited set of hourly data for the previous months	separate field, previous 12 month data are available for selection)	<i>nn</i> str_ <i>streamname_yyyy_mm</i> _hourly.txt Example: 01str_M123_2013_03_hourly.txt
User defined set No.1 of daily data for the current month	Month (daily defined 1) (month shall be selected in	<i>01rp_yyyy_mm_dd_daily</i> .txt Example: 01rp_2013_04_12_daily.txt
User defined set No.1 of daily data for the previous month	separate field, previous 12 month data are available for selection)	01rp_yyyy_mm_daily.txt Example: 01rp_2013_03_daily.txt
User defined set No.1 of hourly data for the current month	Month (hourly defined 1) (month shall be selected in	<i>01rp_yyyy_mm_dd_hourly</i> .txt Example: 01rp_2013_04_12_hourly.txt
User defined set No.1 of hourly data for the previous month	separate field, previous 12 month data are available for selection)	01rp_yyyy_mm_hourly.txt Example: 01rp_2013_03_hourly.txt
User defined set No.2 of daily data for the current month	Month (daily defined 2) (month shall be selected in	<i>02rp_yyyy_mm_dd_daily</i> .txt Example: 02rp_2013_04_12_daily.txt
User defined set No.2 of daily data for the previous month	separate field, previous 12 month data are available for selection)	02rp_yyyy_mm_daily.txt Example: 02rp_2013_03_daily.txt
User defined set No.2 of hourly data for the current month	Month (hourly defined 2) (month shall be selected in	<i>02rp_yyyy_mm_dd_hourly</i> .txt Example: 02rp_2013_04_12_hourly.txt
User defined set No.2 of hourly data for the previous month	separate field, previous 12 month data are available for selection)	02rp_yyyy_mm_hourly.txt Example: 02rp_2013_03_hourly.txt
Hourly data for the indicated month for stream <i>nn</i>	Month (hourly) (month and stream shall be selected in separate field)	<i>yyyy_mm_</i> month_hourly_ <i>nn</i> str.txt Example: 2013_04_month_hourly_01str.txt
Shift data for the indicated month for all 12 streams	Month (shift) (month shall be selected in separate field)	<i>yyyy_mm_</i> month_shift.txt Example: 2013_04_month_shift.txt
Daily data for the indicated month for all 12 streams	Month (daily) (month shall be selected in separate field)	<i>yyyy_mm_</i> month_daily.txt Example: 2013_04_month_daily.txt
Multiday data for the indicated month for all 12 streams	Month (multiday) (month shall be selected in separate field)	<i>yyyy_mm_</i> month_multiday.txt Example: 2013_04_month_multiday.txt
Monthly data for the indicated year for all 12 streams	Year (monthly) (year shall be selected in separate field)	<i>yyyy_</i> monthly.txt Example: 2013_monthly.txt

Alarm log	Logs (all four logs transferred)	alarmlog.txt
Event log		eventlog.txt
Project log		projectlog.txt
Downloaded gas composition		downloadlog.txt
Monthly batch data for the selected month	Monthly batches	batch.txt
Meter serial test data. The last 10 serial test reports are stored.	Meter serial test	Meter_serial_test_report.txt
Flow computer test data. The last 10 serial test reports are stored.	FC calibration report	Flow_computer_test_report.txt
Limited set of hourly data for the current day. The content of the report is identical with the Month (hourly short) report but data included for the previous day only.	Prev. day (hourly short) (stream shall be selected in separate field)	<i>nn</i> strd_ <i>streamname</i> _previous_day_hourly.txt Example: 01strd_M123_previous_day_hourly.txt
Limited set of hourly data for the previous day. The content of the report is identical with the Month (hourly short) report but data included for the current day only.	Cur. day (hourly short) (stream shall be selected in separate field)	<i>nn</i> strd_ <i>streamname_yyyy_mm_dd</i> _hourly.txt Example: 01strd_M123_2013_04_12_hourly.txt
User defined set No.1 of hourly data for the previous day. The content of the report is identical with the Month (hourly defined 1) report but data included for the previous day only.	Prev. day (hourly defined 1)	01rpd_previous_day_hourly.txt Example: 01rpd_previous_day_hourly.txt
User defined set No.1 of hourly data for the current day. The content of the report is identical with the Month (hourly defined 1) report but data included for the current day only.	Cur. day (hourly defined 1)	01rpd_ <i>yyyyy_mm_dd_</i> hourly.txt Example: 01rpd_2013_04_12_hourly.txt
User defined set No.2 of hourly data for the previous day. The content of the report is identical with the Month (hourly defined 2) report but data included for the previous day only.	Prev. day (hourly defined 2)	02rpd_previous_day_hourly.txt Example: 02rpd_previous_day_hourly.txt
User defined set No.2 of hourly data for the current day. The content of the report is identical with the Month (hourly defined 2) report but data included for the current day only.	Cur. day (hourly defined 2)	02rpd_ <i>yyyyy_mm_dd_</i> hourly.txt 02rpd_2013_04_12_hourly.txt
User defined set No.3 of hourly data for the previous day.	Prev. day (hourly defined 3)	03rpds_previous_day_hourly.txt Example: 03rpds_previous_day_hourly.txt
User defined set No.3 of hourly data for the current day.	Cur. day (hourly defined 3)	03rpds_ <i>yyyy_mm_dd_</i> hourly.txt Example: 03rpds_2013_04_12_hourly.txt
User defined set No.4 to 10 of hourly data for the previous day.	Prev. day (hourly defined 4 to 10)	04 to 10rpds_previous_day_hourly.txt Example: 05rpds_previous_day_hourly.txt
User defined set No.4 to 10 of hourly data for the current day.	Cur. day (hourly defined 4 to 10)	04 to 10rpds_ <i>yyyy_mm_dd_</i> hourly.txt Example: 05rpds_2013_04_12_hourly.txt

	where: nn – stream number yyyy – year mm – month dd – day streamname – stream name as entered in the Parameters -> Stream -> Physical stream and Parameters -> Stream -> Virtual stream menu

Annex B. User report editor

Introduction

In UNIFLOW-200 large number of predefined reports exist. The content of those reports cannot be modified. The type and content of the predefined reports described in Annex A.

Beside the predefined reports a tool is provided on the web server of the flow computer to create customized reports, we call them "user defined report". The content and the format of these reports are freely configurable. This Annex D. describes the method how to create and access user defined reports.

User defined reports can only be created via the web server of the flow computer, it cannot be created offline, on the stand-alone PC.

However, the template created in one flow computer can be exported to the PC hard drive and later on can be imported from another flow computer by means of user report editor.

1. Connecting UNIFLOW-200 to PC

To access the web server of the UNIFLOW-200 the Ethernet port of the UNIFLOW-200 shall be connected to the network where the PC is connected.

UNIFLOW-200 can be directly connected to PC via Ethernet cable.

Flow computer - PC Ethernet direct connection

Or it can be connected to PC via switches, routers, LAN/WAN network.

Flow computer - PC Ethernet connection using switch

Note!

UNIFLOW-200 support only fix IP addressing. No DHCP addressing is possible for UNIFLOW-200.

A browser is required to run on the PC to access UNIFLOW-200 web server. We recommend using Firefox for access. Note, UNIFLOW-200 web server is not optimized for Internet Explorer.

Type the IP address of UNIFLOW-200 into the address bar of the browser and press enter. A login screen appears requiring enter the password.

UNIFLOW	-200 MFC Login	
Password :		

	LOGIN	

Enter

Enter the password for Engineering level of access to UNIFLOW-200. User report can only be edited at Engineering level. On Operator or Guest level user reports can be reviewed but not modified.

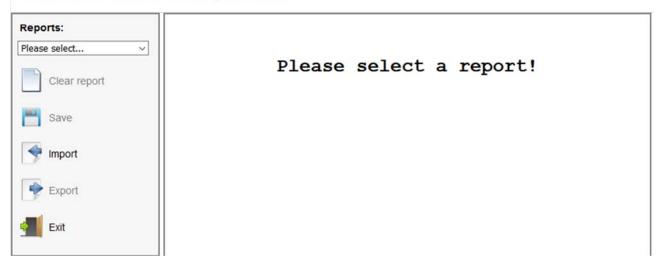

On the main display of UNIFLOW-200 web server click the "User defined report editor" menu item on the lower left corner.

The report editor screen appears.

UNIFLOW-200 MFC Report editor

2. Selecting the report for editing

There are 8 reports available as user defined report. Their name by convention is:

- Defined report11
- Defined report12
- Defined report13

Time remaining: 2:39 Engineer logout

- Defined report14 •
- Defined report15 •
- Defined report16 •
- Defined report17 •
- Defined report18 •

Open the dropdown menu in the upper left corner on the editor screen and select the report to be edited. If the selected report has never been edited before (or has been cleared) then an empty editor pane appears with square grid. having 80 columns and 60 rows.

eucert PROCESS CONTROL

UNIFLOW-200 MFC Report editor

eports:	Cursor position
efined report3 v	Row: 16 Column: 71
Clear report	Insert row Delete row
	Report settings
Save Save	Report refresh rate: hourly
	Report archiving period: shift 🗸
Se Import	Date format: dd/mm/yyyy 💌
Export	Variable definition
	Please select 🕑
Exit	

The available command on the left side command bar are as follows:

Clear report - clears the content of the report being edited

Save Import

Export

Exit

- save the report being edited into the memory of UNIFLOW-200; - import report template from the PC to UNIFLOW-200. Clicking the command, a file browser window opens.

Select the report template file from the PC drive;

- export report template from UNIFLOW-200 to the PC drive. Clicking the command, a file open window appears in the browser. Select the Save file option and in the file browser window select the place where the template file to save.

The default name of the template files is:

- defrep11.zip
- defrep12.zip •
- defrep13.zip .
- defrep14.zip •
- defrep15.zip •
- .
- defrep16.zip
- defrep17.zip
- defrep18.zip •

- return to the UNIFLOW-200 web server main display;

Click the square where you want to enter text (any text can be entered) or want to insert report item (the available items for report see later). The cursor will be blinking on the left side of the square. The current position of the cursor can be seen in the upper right corner of the editor pane.

The Insert row and Delete row buttons will insert and delete one row between the report items.

Click the Save button when finished editing the report template and Export it if you want to use the template in other UNIFLOW-200 as well.

3. Report settings

In the report setting area of the editor pane the parameters of the report can be set as follows.

Report settings		
Report refresh rate:	hourly	
Report archiving period:	daily	\sim
Date format:	dd/mm/yyyy	\sim

3.1. Report refresh rate

hourly

The content of the user defined report will be updated every hour. This parameter is not alterable.

3.2. Report archiving period

Select from the dropdown menu the archiving period of the report. Available options:

- shift
- daily
- multiday
- monthly
- yearly

At the end of the archiving period the reports will be closed and archived. For example, if a monthly report contains hourly data, then at the end of each hour the data for the last hour added to the report.

After the last hour of the month the report is closed and will not be altered any more.

The name of the user defined reports is as follows:

nn_RP_yyyymmdd_hh00_xx.txt where: nn the serial numl

yymmdd_hh00	
nn the ser	ial number of the report from 11 to 18
уууу	year
mm	month
dd	day
hh	hour
ХХ	label indicating the archiving period and also indicating if report is already archived or it is still open (updated every hour)
lf xx = xa, t	hen the report is archived, the archiving period is finished.
If the repor	t is still updated then the label indicates the archiving period as follows:
xx = ss	shift
xx = dd	day
xx = tt	multiday
xx = mm	month
xx = yy	year

If for example the report 11 is archived daily (and the end of day hour is 06:00), then the name

11_RP_20201211_2000_dd.txt denotes a report which contains hourly data from 2020.12.11 07:00 to 2020.12.11 20:00. At the end of the day (on 2020.12.12. 06:00) the report is archived and the name become: 11_RP_20201212_0600_da.txt

The archived and the open reports are accessible in the UNIArchive program of the U200ToolBox suit (see section 5).

3.3. Date format

The available options are as follows:

- dd/mm/yyyy
- mm/dd/yyyy
- yyyy/mm/dd

The system time on the reports will be displayed according to this setting.

4. Defining report items

In the Variable definition area of the editor pane the data point to be put onto the report can be selected.

Please select V	Please select ~	Variable definition		
			Please select	\sim
			Theuse selection	

Put the cursor into the cell on the report area where the report item (data point) to be started. From the dropdown menu select the category of data. Available categories are:

- Machine
- Date
- Table
- M01 stream
- M02 stream
- ...
- M12 stream

Please select V Machine
The state of the s
Insert variable into report Date
Table
M01 stream
M02 stream
M03 stream
M04 stream
M05 stream
M06 stream
M07 stream
M08 stream
M09 stream
M10 stream
M11 stream
M12 stream

Depending on the category selected one or more additional data level will appear. Select at each level the desired category while get to the required data point.

For example, if you want to insert the serial number of the flow computer on the report your selection looks like this:

	Machine	~
Field length:	Serial no.	~
	12	
	Left	~

You should specify some additional parameter also. In this example the Field length (the number of cells you want to reserve for this data point) and the Alignment (left, center or right).

After the selection is done and all the requested parameters are set, press the Insert variable into report button. On the report question marks with turquoise background will occupy the cells reserved for that variable. If you locate the cursor over the field the background color turns to red and a pop-up label will show the name of the variable.

Report start time:	3333333333333333	2 2 2		
Report stop time:	3333333333333333	222		
Data (tima	St D I D I	//: D //	1 I I I I I I I I I I I I I I I I I I I	/ / / / / / /
Date/time	St Date->Date/	/time->Report pe	eriod stop time-:	>yyyy/mm/dd hh:mm->
Pate/time ???????????????	St Date->Date/	/time->Report pe		
	UV.	www.		MONOMON. 000

The available items for selection in the different category are listed in the next paragraphs.

4.1. Machine

• User name

The company name is inserted as defined in the General data / Company data parameter section

• User address

The company address is inserted as defined in the General data / Company data parameter section Machine name

The machine name is inserted as defined in the General data / Version control parameter section

Serial no.

•

The machine serial number is inserted as displayed in the General data / Version control parameter section

4.2. Date

- System time System date and time is inserted. It will show the date and time when the report is generated/updated
- Date/Time
 - o Report period stop time
 - o Report period start time

The available date/time formats are depending on the Date type selected in report settings. E.g., in case of yyyy/mm/dd date type the available options:

- > yyyy/mm/dd hh:mm
 - yyyy/mm/dd hh:00
 - mm/dd hh:mm
 - mm/dd hh:00
 - > yyyy/mm/dd
 - ➤ mm/dd
 - ➤ hh:00-(hh+1):00

4.3. Table

In this category a multi column table can be defined.

There are some limitations regarding the size and the format of the table to be taken into account when defining it.

• the maximum number of columns: 10;

• only variable item is allowed in the row, no text is allowed;

The length of the table (the number of rows) is determined by the report archiving period and the period of the variable selected. The possible combinations are shown below.

Report archiving period	Period of the variable	Number of rows in the archived report
Shift	Hourly	8
Daily	Hourly	24
	Shift	3
Multiday (assuming 10 days)	Hourly	240
,	Shift	30
	Daily	10
Monthly (assuming 31 days)	Hourly	744
	Shift	93
	Daily	31
	Multiday	4
Yearly (assuming 365 days)	Daily	365
, , ,	Multiday	43
	Monthly	12

Put the cursor into the cell in the Table row on the report area where the report item (data point) to be started. Select the required item in the variable definition pane, like this.

Report settings			
Report refresh rate:	hourly		
Report archiving period:	monthly		
Date format:	yyyy/mm/dd	~	

	Table	-
	Hourly	
olumn definition		
	M01 stream	\sim
	Cumulative total	\sim
	UVOL	~
	Total	~
nteger digits:	12	
ecimal digits:	0	
	Right	~

Insert variable into report

In this particular example a monthly report is defined and the stream M01 uncorrected volume cumulative total counter is put into the table every hour. So that a table with 744 rows will be archived by the end of month. The width of the column is 12 digits (integer number displayed) and the numbers are aligned right.

After the selection is done and all the requested parameters are set, press the Insert variable into report button. On the report question marks with yellow background will occupy the cells reserved for that table variable. If you locate the cursor over the field the background color turns to red and a pop-up label will show the name of the variable.

Report start time:	333333333333333	<u>???</u>			Ш
Report stop time:	\$\$\$\$\$\$\$\$\$\$\$\$	3.5.5			
Date/time	Str 1	Str1	Str1	Str1	
	UVOL, m3	CVOL, m3	Mass, kg	Energy, GJ	11.
\$\$\$\$\$\$\$\$\$\$	<mark>333333333333333</mark>	3333333333333	33333333333333	3333333333333	Ш
				VOL->Total->12->Rig	

If you click on an existing variable placement (field) the definition of that variable will be displayed on the variable definition pane. You can modify your selection as desired. After pressing the Change column button, the variable selection will be modified accordingly.

The available options at the different level in the column definition are as follows:

- M01 stream
 - Periodic total (periodic totals: for the period the variable defined for, min. and max.: flow rates)
 - ≻ CVOL
 - Total
 - Fault total
 - Premium total
 - Min.
 - Max.
 - > UVOL
 - same as for CVOL
 - Raw UVOL
 - same as for CVOL, except Min. and Max.
 - Mass
 - same as for CVOL
 - Energy
 - same as for CVOL
 - Cumulative total

0

- > CVOL
 - Total
 - Fault total
 - Premium total
 - > UVOL
 - same as for CVOL
 - Raw UVOL
 - same as for CVOL
 - Mass
 - same as for CVOL
 - Energy
 - same as for CVOL
 - CO2 mass
 - same as for CVOL
- o Process data (averages for the period the variable defined for)
 - Temperature
 - Absolute pressure
 - Differential pressure
 - Line density
 - Compression factor
 - Carbon number
 - Inferior calorific value
 - Superior calorific value
 - Relative density
 - Normal density
- o Gas component

- > Nitrogen
 - 🎸 Min.
 - Max.
 - ✤ Average
 - Carbon-dioxide
- > Hydrogen-sulfide
- > Water

 \triangleright

- > Helium
- > Methane
- > Ethane
- > Propane
- n-Butane
- i-Butane
- > n-Pentane
- i-Pentane
- n-Hexane
- > n-Heptane
- > n-Octane
- > n-Nonane
- > n-Decane
- > Oxygen
- Carbon-monoxide
- > Hydrogen
- > Argon
- Ammonia
- Benzene
 - for all components same as for Nitrogen
- o Flow time
 - Total flow time
 - Fault flow time
 - Note, the flow time displayed in hours with decimal part of hours (not in the format hour and minute).
- M02 stream
 - same as for M01
- ...
- M12 stream
 - o same as for M01
- Date/time

Data/time when the current row of the table is updated.

The available date/time formats are depending on the Date type selected in report settings. E.g., in case of yyyy/mm/dd date type the available options:

- > yyyy/mm/dd hh:mm
- > yyyy/mm/dd hh:00
- mm/dd hh:mm
- > mm/dd hh:00
- > yyyy/mm/dd
- ➤ mm/dd
- ➤ hh:00-(hh+1):00

4.4. Stream data (M01...M12)

In the stream data category individual data (cumulative totals, interval totals, averages) for the selected stream can be inserted into the report.

The category of data available at stream level are as follows:

- stream name
- actual period
- previous period

4.4.1.Stream name

Insert the name of the stream as entered in the Stream definition menu.

4.4.2. Actual/Previous period data

The term "period" in this context means the Report archiving period as set in the Report settings section. In the example below the period is "daily".

Report settings		
Report refresh rate:	hourly	
Report archiving period:	daily	\sim
Date format:	dd/mm/yyyy	~

The Current period means the period being in progress.

The Previous period means the last period which has been finished.

The data point (variable) itself also can have period. The period of the data point cannot be shorter than the report archiving period. E.g., into the daily report data point with daily, multiday or monthly period can be inserted. The limits are shown in the table below.

Report archiving period	Period of the variable
Shift	Shift Daily Multiday
Daily	Monthly Daily Multiday Monthly
Multiday	Multiday Monthly
Monthly Yearly	Monthly no periodic data available

Data for the current period will be updated in the report in every hour and their value may change.

Value of the data for the previous period will never be changed on the report as it is related to the period already finished.

The available options at the different level in the stream data definition are as follows (they are identical to the options available for table items, see 4.3):

- Actual period
 - Periodic total (periodic totals: for the period the variable defined for, min. and max.: flow rates)
 - ≻ CVÖL
 - Total
 - Fault total
 - Premium total
 - ✤ Min.
 - ✤ Max.
 - UVOL
 - same as for CVOL
 - Raw UVOL
 - same as for CVOL, except Min. and Max.

 - same as for Current period 0

Unit of measurement is not appended to the individual stream data. It should be entered into the report as text.

5. Accessing user defined reports

User defined reports can be accessed in different ways described below.

5.1. Saving reports to PC by UNIArchive

The U200ToolBox suit includes program for reading archive files from UNIFLOW-200.

Launch the UNIArchive from the start menu of the U200ToolBox.

U200ToolBox Version 201211		¤" 🛛
CONTROL	UNISetup Configuration setup	
	UNIArchive Reading archives	
	UNIUpdate Firmware update	EXIT

Select the name and/or the IP address of UNIFLOW-200 to be read and press Upload from flow computer.

The file names of the user defined reports are listed in the "Detailed logs" column.

Click the check box in front of the file names one-by-one, or, click the "Detailed logs select" check box if you want to save all detailed files.

The name of the selected files appears in the "Selected files" column.

Click the Save selected files button to save files to drive of the PC.

5.2. Saving reports to flash drive

Insert flash drive into the USB port of UNIFLOW-200. Wait until message with red background appears on the display, suggesting saving the data before upgrading firmware or parameter project. Leave the selection to "yes" and press OK button. The Archive data transfer page appears.

Archive da Port Data file Start	ta transfer USB (Pendrive) Select all no	
Menu	Change (1))

Leave the port selection to "USB (Pendrive)".

Select the "Data file" field and by pressing Change button select the file you want to transfer. Or leave it to "Select all", which means all the archive files will be transferred to flash drive.

Select the "Start" field, change it to yes and press OK.

Message Transfer in progress... indicates that the files are being copied to flash drive.

When copying finished a message appears saying you can remove the flash drive.

UNIFLOW-200 will create a directory on the flash drive which name is the serial number of the UNIFLOW-200, e.g., 200-020. The archive files are placed into this directory.

5.3. Printing reports to serial printer

Navigating on the display of UNIFLOW-200 go to the page Flow / Data transfer / Archive data transfer (see above in 5.2.). Change the port to the Com port where the serial printer is connected to. Select the data file to be printed, change Start to yes and press OK. The report will be sent to the printer.

5.4. Printing reports to serial printer when the report generated

If serial printer is permanently attached to UNIFLOW-200 then it is possible to set up printing the user defined report when it is generated.

In the Com port setup, if the function of the Com port is serial printer, then the automatic printing can be enabled. Select the period of printing "daily" (if only daily reports to print) or "daily & hourly" (if both daily and hourly reports to print). Set the selection box to "yes" for the user defined reports to be printed automatically. In the example below user defined report 3 and 4 selected for printing.

6. Sample user defined report

Below is a sample of the user defined report. The report archiving period is "monthly".

On the subsequent pages you can see sections from the report as generated during the month.

* on the placement indicates that no data is available for that period. Such mark denotes all the future date. If it appears for the date in the past, then most probably the flow computer was out of operation at that moment of time.

######## on the placement indicates that the number is too big for the format (integer digits and decimal digits) specified for that data point.

Annex C User Modbus editor

Introduction

UNIFLOW-200 has two predefined Modbus register assignments (register sets):

- Standard Modbus register map (see section 10.5 in the Manual)
- Daniel Modbus register map (see section 10.6 in the Manual)

To increase the flexibility of the Modbus communication a third, user defined register map is implemented, it is called User Modbus tables.

The User Modbus table is fully configurable. Data point assigned to registers and data format are set during the configuration, in the User Modbus editor.

User Modbus table can be edited in the ToolBox software suit in UNISetup. No editing via UNIFLOW-200 display and keypad is possible.

The data format in the User Modbus table is according to the standard Modbus specification, see section 10.4.3 in the Manual. No Daniel data format is supported.

1. Adding User Modbus table to parameter project

If parameter project is created as new project with ToolBox version 210105 or later then the default User Modbus table is automatically created.

The default User Modbus table cannot be edited. It can be opened and saved under different name. The saved copy of the default table can be modified as desired.

New empty User Modbus table can also be created and filled as desired.

Up to 16 User Modbus table can be created. Any of them can be assigned to Ethernet port or to any serial port. The assignment can be modified even during the operation of the flow computer.

If parameter project was created with earlier then 210105 version of the ToolBox then the procedure is as follows:

- open the parameter project;

- go to the menu item Project / Project conversion

UNISetup Version	210105				
Project	_				
New Project Open	orosan_2str_u	ser_modbus]>			
Save as					0
Connect to FC Ctrl-K	roject

General parameter	5	Stream parar	neters		PID Control loop
Setup		Setup Physical stream	1 🗸		Setup

- follow the instruction and save the converted project.

2. Editing User Modbus table

When the project is open in UNISetup click the General parameters Setup button.

Param setup V.2	ave project				P
O Board setup: O Board 1	IO Board 2	IO Board 3	IO Board 4	IO Board 5	Modbus signals

List of the existing User Modbus tables will appear. In case of new or converted project only the default table will be shown. The buttons on the table list window allow:

New - create new table

Open – open existing table

Save – save table

Save As - save table under different name

Delete – delete table

OK – confirms the operation

Cancel – cancels the operation

After entering name for a new table and clicking OK an empty table appears and only the Insert button will be active.

Enter the register address where you want to put data point.

Then, from left to right select the data category, main group, group, subgroup and finally the data point. After the selection is made click OK.

The data point will be seen in the register list.

	Delet	ta										
	Edit De	ta										

In the data selection window practically any data point which exists in the Uniflow-200 can be assigned to any Modbus register.

The data points include flow rates, cumulative totals, periodic totals, averages, gas composition, process data, alarms, ultrasonic meter diagnostic information, I/O boards channel measured data, etc.

If you modify the table comparing to the status when it was opened or created, a Save icon (a floppy disc) will appear below the table icon. Click the icon to save the changes.

Selecting data points

Click to any field of the data point to select it.

Holding shift key and clicking a new data point will select range of data points.

The Cut, Copy, Delete and Edit format buttons will work with single data point and with range of data points as well.

The function of the buttons on the register list window is as follows:

Cut – removes data point for subsequent insertion into different register;

Copy – copies data point for subsequent insertion into different register;

Paste - inserts data point(s) after Cut or Copy command. Will request enter the starting register to paste;

Register address	
Register address :	(0 65535)
Ok	Cancel

Insert – insert data point into the selected register;

Quick insert – insert the next data point from the data subgroup into the next register;

Delete – deletes data point (or range);

Edit Data - allows modify the data point;

Edit Format – allows set the data format. The available data formats are:

- int16 (16 bit unsigned integer)
- int32 (32 bit signed integer)
- float32 (single precision floating point number)

- float64 (double precision floating point number)

Single data point or range of data points data format can be edited as shown below.

Some limitations to be taken into account.

In the Gas composition data group, there are 3 subgroups:

- Inuse gas composition
- Downloaded gas composition
- Gas composition read from gas chromatograph

From the latter two subgroups only one can be selected for any stream, not both. The gas composition can come from the supervisory system (downloaded) or can be read from gas chromatograph.

In the Meter serial test, there are two data groups:

- Master
- Slave

Only one of them can be selected in any unit, as far as in the serial test on flow computer must be the Master and the other(s) must be the Slave.

In the Master unit the "Slave data" (data read from Slave unit) can also be assigned to Modbus registers.

3. Assigning User Modbus table to communication ports

Serial port

In the General parameters setup window select the Com tab and select the desired serial port. Set the function to User Modbus and select the User Table to assign to that serial port (UM_1 in the sample below).

_ 🗍 Ge	eneral parameters							
	Save parameters							
Com	Ethernet Period settings	User def. display	User data	Password	General stream	Batch	User Modbus	
-				_				
	Interface :	Com1		-				
-								
	Type :	RS232	•	•				
3	RTS/CTS handshake :	no	•	•				
11 	Baud rate : 9600			•				
1	Data bit :	8		•				
	Stop bit :	1	•	•				
	Parity :	no		•				
	Function :	User Modbus		-				
	User Table :	UM_1	•	•				
	Mode :	default						
	Modbus dev. addr. :	UM_1						
	UM_2							

Ethernet port

In the General parameters setup window select the Ethernet tab.

Set the register assignment to User Modbus and select the User Modbus table to assign to the Ethernet port (UM_1 in the sample below).

🔲 General parameters							
Save parameters							
Com Ethernet Period settings	User def. display	User data	Password	General stream	Batch	User Modbus	
Interface :	Ethernet						
IP address :	192.168.010.090						
Subnet mask :	255.255.255.000						
Default gateway :	000.000.000.000

Reg. assignment :	User Modbus						
	UM_1		1				
DHCP server :	default						
	UM_1						
	UM_2						

4. Checking User Modbus register content on the display

Go to the Main menu / Flow / Modbus regs menu item.

Go to the parameters section. Set the register mode to User Modbus.

The name of an active User Modbus table appears. If different User Modbus tables are assigned to different ports then you can select between the active User Modbus tables.

Set the starting register and go to Data section.

Content of the registers will be displayed in hexadecimal format and in the format set for that register (int16, int32, float32 or float64).

Annex D. Application notes for HTI4x15 I/O board

The HTI4x15 I/O board is designed to communicate with transmitters with HART protocol. One board is capable to serve 4 HART loops with maximum 15 process variable (PV) on each loop. The maximum number of input channels on one board is limited to 32.

Multidrop mode

In multidrop mode one loop can accommodate maximum 15 transmitters and maximum 15 PVs can be read. If more then one PV is read from one transmitter then the maximum number of transmitter in one loop is decreased accordingly.

The parameters of the HART channels are setup in the I/O signal setup menu. The process variables from the transmitters are assigned to the channels of the IO board. The assignment shall be started from channel 1 and shall be continuous. Parameters to be defined for each channel are as follows:

- serial number of HART loop (1 to 4);
- polling address of the transmitter (1 to 15)
- serial number of the process variable (1 to 4)

The low scale and high scale values for the channel must be set equal to the low scale and high scale value set in the transmitter.

Transmitter mode

In transmitter mode only one transmitter is connected on one loop. In this mode the transmitter current signal can be connected to some external device (e.g. PLC or DCS) analog input board while UNIFLOW-200 will read the process variable from the transmitter on HART protocol.

The polling address in transmitter mode must be set to 0.

Transmitter settings

The parameters of the transmitter shall be setup before it is connected to UNIFLOW-200. The hand held communicator can be used to setup the transmitter.

Precautions to be observed in transmitter setup:

- the low scale and high scale values in the transmitter must be equal with the ones set in the UNIFLOW-200;
- the polling address must be from 0 to 15;
- transmitters connected to one loop must have different polling addresses;
- no transmitter can be set to burst mode.

Wiring and cabling

Transmitters shall be wired as shown in Annex B.

The load resistance in the HART loop (if there is no other consideration) shall be R_t = 250 ohms. HART recommend resistance from 230 to 1100 ohms.

Rules to be followed selecting the loop resistance:

the minimum operational voltage should be provided for all the transmitters connected in one loop. This minimum voltage is from 6 to 10 V depending on the manufacturer and type of the transmitter. The Rt load resistance determined form the equation:

 $U_{\text{transmitter_min}} < U_{\text{power}} - n * 4\text{mA} * (R_t + R_{\text{wire}})$

where: Upower - voltage of the power supply

- number of transmitters in one loop

R_{wire} - resistance of the cable

- the RC time-lag shall be calculated for the cable. The RC time-lag depends on the
- Rt resistance;

n

- quality of the cable (resistance, capacitance, isolation material);
- input capacitance of the HART transmitters;
- presence of other equipment in the loop.

The RC time-lag shall not exceed 65 microseconds.

NOTE

Maximum load of the 24V_{out} transmitter power output is 200 mA total (as sum of loads on every board providing transmitter power output).

Terminal pairs of the pulse inputs not in use must be connected together (short circuited).

Terminal pairs of the 4 terminal points of the RTD inputs not in use must be connected together (short circuited).

To maintain the accuracy of the analog inputs protective ground shall be connected to grounding pin (lower right corner of the backplane) even if unit is powered from 24 VDC power supply.
